"There is just one clause in his suggested language which does not meet with my approval, and that is the sentence relating to no deduction for depreciation in case the sinking method is used. I do not want to start on the question of depreciation, because I know that I would get a way beyond your time this afternoon. But, that sentence ought to be eliminated and if any of you are interested, I will be glad to sit down and explain the reasons. I will guarantee that I can show you.

"Mr. Boren: You do not believe then that line 9, page 7—in cases which may arise providing for refunds—you do not believe that refunds or the refund method should be adopted or would be as successful as a temporary rate?

"Mr. Maltbie: I do not. One of the criticisms against regulation everywhere is that it takes so long to get anything done. Complaint is made and then an investigation is had which involves the taking of testimony and with a large company it strings along and the best that you can do is for 3 or 4 years. The public says that nothing happens. Regulation is no good.

"Now, the New York law permits us to issue a temporary order immediately. If we get the rate too low, below a fair return as the investigation shows, then it is adjusted in the final rate. That has worked satisfactorily and as I say has been upheld by the court of appeals.

1824 "The Chairman: In brief, how do you fix your temporary rate?

"Mr. Maltbie: The temporary rate is fixed upon the basis, according to the law, of the original cost of the physical properties, less depreciation.

"Now, we make an investigation. In some cases the books of the company show the original cost of the property and we have an order out now which will require all of the utilities outside of the railroads in the State of New York to produce an inventory and show the original cost of their property before the end of this year.

"So, if the book shows we get the original cost from the books. If the books do not show, we are allowed to estimate the original cost.

"Also the depreciation, if the books show accrued depreciation, we take that from the books. If we do not think that they do, we can quickly make an estimate or fix the minimum amount that we will deduct and deduct that from the original cost, getting the original cost less depreciation, taking all of the physical property, material, supplies, as well as plant. Then, an analysis of the operating expenses show what the revenues should be and we can fix a rate of return on it and do fix it. So far there has not been a temporary rate fixed on that basis reversed in the State of New York; not one.

"The Chairman: In effect you give consideration to every fact that you do in fixing the final rate, but you act hurriedly and save yourselves as to the constitutional question in the final rate where you pay the company any deficiency that may be found due.

"Mr. Maltbie: No, Mr. Chairman; I have not included reproduction cost less depreciation.

"Now, according to the law of the land original cost and reproduction cost less depreciation must be taken off of each one and must be considered. There are a number of other things that might be considered before fixing a final rate, but in a temporary rate we do not need to give any consideration to reproduction cost less depreciation; none at all.

"The Chairman: Does not the fact that you subsequently award the utility the proper amount of compensation in case you under-compensate them in temporary rates save the constitutionality of your method?

"Mr. Maltbie: Unquestionably it does. The opinion of the Court of Appeals pointed that out."

(Counsel for the Defendants then offered extracts from the proceedings in H. R. 11662 before a Sub-Committee of the Committee on Interstate and Foreign Commerce of the House of Representatives, 74th Congress at the Second Session, April 2, 3, 7, 14, and 15, 1936. Counsel stated that the provisions of Section 4(a) and Section 5(a) shown on pages 2 and 3 were offered for the purpose of showing that the provisions of the Act then under consideration were the same provisions as in the Act which is now known as the Natural Gas Act.

He also offered certain statements from pages 28 to 29 and from page 10 and made by Mr. De Vane,
1825 solicitor, Federal Power Commission, with respect to the Act which was then under consideration; the statement offered from page 10 beginning at the top of the page and extending down to the words "I shall not, in my presentation this morning."

He then offered that portion of his statement commencing on page 28, commencing with the language "Section 4 of the bill in general relates to wholesale rates," and continuing through the statement by Mr. DeVane on page 29, ending with the language "If it finds the complaint is well founded, it has authority to prescribe a new rate. That is correct."

At the direction of the Examiner, the extracts offered in evidence from the above mentioned documents were copied into the record by the reporter as follows:

"Sec. 4(a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

"Sec. 5(a) Whenever the Commission, after a hearing had upon its own motion or upon complaint, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any service rendered or to be rendered in the transportation of natural gas in high-pressure mains in interstate commerce, subject to the jurisdiction of the Commission, or that any rule, regulation, practice or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order.

(Extract on page 10 is as follows:)

"Mr. De Vane: Mr. Chairman and members of the Committee, my name is Dozier A. DeVane. I am solicitor for the Federal Power Commission and have been in that position now for approximately 2½ years. I appear here this morning at the request of the Chairman of your full Committee and of your sub-committee, and that the record may be clear, may I also state that I do not appear in the capacity of a representative of the administration in connection with any legislation that it has submitted to the Congress.

"This Committee will recall that as a part of H. R. 5423 was title III, which had for its purpose the regulation of this industry. Title III of that bill was substantially the same in language as the part of title II that related to the regulation of the electric industry.

"Substantially the only difference was that gas was substituted for electricity in the language of the bill. After the hearings upon that bill, titles II and III—when I refer to title II, I mean that part of the bill providing for an amendment to the Federal Water Power Act bringing under Federal regulation electric utilities—both that title and title III, which provided for the regulation of the natural-gas industry was referred to the same sub-committee and considered by the same sub-committee.

"I suppose it is not out of place if I should say for
1826 the record here that title III, which related to the
regulation of the gas industry was not reported out with title I and title II.

"The bill that you have now, H. R. 11662, is in substantially all respects, insofar as it goes, similar to the provisions of the Federal Power Act, with reference to the electric industry. The bill itself does not go quite so far as nor does not confer quite as much jurisdiction upon the Commission as does the Federal Power Act.

(Extracts on pages 28 and 29 are as follows:)

"Section 4 of the bill in general relates to wholesale rates which are the rates that are subject to the Commission's regulation. Section 4(a) provides that the rates and charges shall be just and reasonable.

"Section 4(b) prohibits undue preference.

"Section 4(c) provides for the filing of rate schedules and contracts with the commission.

"Section 4(d) provides for the method of changing rates; and

"Section 4(e) gives the Commission authority to suspend rates pending an investigation when new rates are filed. There is a limit of time within which these rates may be suspended, and if the case is not disposed of within a period of 6 months in all from the date of their filing they go into effect. This section is substantially the same as the section on the same subject matter in the Federal Power Act.

“Mr. Lea: Mr. DeVane, under what conditions would rates be put into effect? That is, what would be the procedure?

“Mr. DeVane: In the beginning?

“Mr. Lea: Yes.

“Mr. DeVane: The companies will simply file their schedules.

“Mr. Lea: And those schedules would prevail unless the Commission saw fit to, after a hearing and notice, establish a rate?

“Mr. DeVane: Yes, sir; those rates would prevail. The rates that the company makes effective at the date of filing are the rates that will continue in effect until they are changed either by the company, as provided in Section 4, or by the Commission after hearing.

“Mr. Lea: There would be, I take it, no duty upon the Commission under this bill in the absence of complaint or just reason to call for interference to establish rates.

“Mr. De Vane: No, sir; the Commission can only establish rates after investigation and hearing. Now, that investigation can be undertaken under section 5 of the bill either on the Commission's own initiative or upon complaint.

“Mr. Cooper: Let me see if I understand you
1827 there. That is, the gas companies can establish
their rates?

“Mr. De Vane: Yes, sir.

“Mr. Cooper: They do not have to go to the Commission; they can establish them themselves?

“Mr. De Vane: You are talking about in the beginning now?

“Mr. Cooper: Yes.

“Mr. De Vane: They file their schedule of rates.

“Mr. Cooper: And they put them into effect.

“Mr. De Vane: Yes, sir.

“Mr. Cooper: And anyone who wants to file a complaint goes to the Commission; is that right?

“Mr. De Vane: That is correct; and they can change their rates, Mr. Cooper, by filing new schedules under section 4(d). After they have filed them with the Commission and announced those new rates, the Commission has the power to suspend and investigate, and the suspending power extends for a period of 5 months.

"Mr. Cooper: Well, does the Commission have the power to suspend as soon as the protest has been filed?

"Mr. De Vane: Not in the case of protests, Mr. Cooper; no, sir. The power of suspension only applies to a new rate.

"Mr. Cooper: What I mean is this, if the gas company establishes a rate and someone files a complaint against that rate with the Commission, does the Commission automatically suspend the rate?

"Mr. De Vane: It has no authority to suspend that rate.

"Mr. Cooper: I see. They first have to consider the case.

"Mr. De Vane: That is correct.

"Mr. Cooper: Does it have authority, if it finds that the complaint is well founded?

"Mr. De Vane: If it finds the complaint is well founded, it has authority to prescribe a new rate. That is correct."

(At this point the Examiner directed the reporter to copy into the record a stipulation among counsel for the commission, for complainant and for the defendants dated December 5, 1939 as follows:

STIPULATION

"It is hereby stipulated and agreed that Exhibits 197 and 198, introduced by the witness, Charles W. Knapp, Jr., on redirect examination and his testimony with respect thereto, page 8580, line 13, through page 8583, line 23, will not be used or referred to on the argument before the Federal Power Commission in the hearing on the motion for 1828 an order for an immediate reduction in rates, and should not be considered as part of this case on such hearing.

George Slaff,
Attorney for Federal Power Commission.
John E. Cassidy, by
Harry R. Booth,
Attorney for Illinois Commerce Commission.
J. J. Hedrick,
Attorney for Natural Gas Pipeline Company of America and Texoma Natural Gas Company.

Dated December 5, 1939.")

1829 H. B. DORAU, a witness for defendants called for redirect examination, testified as follow:

(December 13, 1939.)

Redirect Examination by Mr. Culton.

In my original examination, I made the statement begining on page 5633 that "the imposition of a style of regulation which was developed for and adapted to relatively mature and maturing industries, upon a young and growing industry still in the stages comparable to the early states of these industries now so much more readily regulated, would be a distinct threat to their growth and development," and on line 23 I made the statement that by "style" I merely meant to adapt a somewhat commoner term to express the idea that includes the particular format, layout, procedure, manner, standards, bases, actions, and judgment and that it had no implication in it of the question of regulation at all.

Then, beginning with line 16 at page 5635 of the record and continuing over on to the following page, I testified as follows:

"In my opinion, if there is going to be regulation of an industry in which it is apparent that there is a large function for enterprise to perform, which is an industry still in the stage of development and in which those social results may be looked forward to from the function of enterprise, then all I would want to say is that the responsibility for properly rewarding and encouraging that enterprise definitely falls on a regulatory authority and it will have to assume the responsibility for keeping enterprise properly fed and clothed and alive if,—and this is again assuming,—it desires to keep enterprise alive in an industry of this sort. I believe that if the nature and rigid formula of regulation is imposed on an industry in its teen age, that it will discourage its growth and development, and that the way in which that can be avoided is by a proper and appropriate recognition of the award for the disposition to be enterprising."

In giving that testimony, I certainly did not intend to pass judgment on the question of regulation as such. My discussion, I thought, was perfectly clear. I was merely commenting on certain aspects of the regulatory policy as adaptable to this kind of an indsutry. I did not intend to imply any comparison between regulation and non-regulation at all in that testimony. So far as I know, I neither did, nor meant to, imply any such comparison. I was discussing an aspect of the regulatory policy. I did not intend in any of my answers to questions propounded to me on cross-examination with respect to regulation to convey the idea that I was opposed to all regulation. That would be contrary to my frequently expressed opinion to the contrary. I have never, to the best of my recollection, in all my life expressed an opinion to the effect that I was opposed to all regulation of utilities or comparable concerns.

I would like just to make the record perfectly clear as to the idea I was intending to convey in my discussion of the question of regulation. Because the questions came and were answered in a rather disjointed fashion, I would appreciate it if I would be allowed to make a summary statement.

I responded to questions raising rate of return issues only, or questions which I considered as having a bearing on the rate of return issue only. I testified that in my opinion regulation to be most effective and to meet the test of social economy must be adapted to the characteristics of the industry to be regulated, and that, therefore, industries not having the essential and primary characteristics of public utilities are not to the best advantage regulated under the formula which has been developed for public utilities.

I expressed the opinion that industries in which the investment faced a large measure or risk and uncertainty were not suited to a system of regulation which relies on the determination of a maximum or ceiling rate of return since the very nature of risk and uncertainty calls for the chance of gain being held open and the opportunity for profit to appear to exist.

I expressed no opinion as to the desirability or undesirability of regulation as such. I did not express an opinion adverse to the regulation of public utilities and would like to clearly state that my position has always been and continues to be in favor of intelligent, effective regulation of utility industries to the best long-term interest of society as a whole.

With respect to the manner of public utility regulation, I expressed one reservation, namely, that the increasing rigidity, sometimes mistaken for true effectiveness, of the regulatory process was discouraging to enterprise and to risk and uncertainty assumption and that under a more exacting administration of the traditional public utility formula which eliminates those classes of gain due to lags, imperfections, and infrequency of rate adjustments, it becomes the responsibility of regulatory authorities to specifically recognize the necessity for enterprise encouragement and reward if it is desired to allow such an industry to develop to its economic optimum.

No comparison as between the states would be justified as to the effect of regulation on the attractiveness of the investment opportunity, because one state might be larger than another and of much greater population, and one might have grown faster than the other. Moreover, it is entirely possible that other factors make one state more attractive than another. It would and could prove nothing unless the situations were otherwise comparable. Thus, as a practical matter, the only comparison which could properly be thought of is that between the conditions which exist in a given state under a given administration and what might be the conditions if there was regulatory recognition of encouragement of enterprise.

You ask whether the fact that an industry continues to grow proves that certain aspects of the regulatory policy and procedure did not have a discouraging or retarding effect. No, I do not think that proves anything of the sort. We know that good money often follows after bad money and it is often the economical thing to do to invest more in order to get a somewhat larger return than would otherwise be available for the original investment. Neither does it prove anything that an industry was able to borrow additional capital or that it invested revenue set aside for depreciation in some additional property. In the case of public utilities, there is usually an obligation to meet the service requirements of the market which the utility has held itself out to serve or for which it holds a franchise. If this requires more capital, that capital must be found. The railroad industry has added to its capital investment despite a long period of unsatisfactory return. It may become
1831 necessary to pay more for additional capital than capital as a whole is earning in order to meet a public responsibility or even to retain control of an enterprise.

You ask if individuals necessarily leave an industry because they become discouraged as to its outlook, that is, because they do not see the possibility of reward in proportion to the enterprise which they have displayed. Obviously not as a general rule, and particularly not those who have been in an industry long enough to have come into positions of managerial responsibility. The tendency is to stay since changes at such stages in life are difficult. The effect of a discouraging outlook in this respect is twofold, primarily on the disposition of existing management to exercise itself as it might if it could look forward to compensatory rewards, and on the attractiveness of such an industry to those who are choosing what industry to enter for the first time.

At page 7123 of the record it appears that in answer to the question "The fact that with respect to this utility there have been frequent rate revisions and frequent rate reductions has not discouraged investment in that utility, has it, to your knowledge" I answered "Not to my knowledge." I then added that I do not believe so. In making that statement, I had in mind in connection with the Potomac Electric Company that not all of the results of good management in the previous period were eliminated by rate reductions. I attempted to make clear that there was a great difference in holding out some sharing in profits as under the Washington Plan and the operation of frequent rate reductions when no such chance of sharing appeared to exist. In this respect everything that can be said in favor of the Washington Plan is in support of my position that regulation would be in the larger public interest if it held out the possibility of an extra gain for extra effort or hazard.

I was asked to enumerate causes of trouble in utilities other than lack of sufficient reserves, and stated that they were undoubtedly financial causes, and then the question of bad capitalization came up. You ask what I meant by the expression "bad capitalization". If I remember correctly, the discussion had to do with natural gas companies and the capitalization of natural gas enterprises. I had in mind the quality of the capital structure rather than the quantity as reported by the total of the par or stated value of all outstanding securities. I was then, and am now, of the opinion that the mere quantity of capitalization was not important for the financial experience of investors in the natural gas industry. I know of no instance where there had been financial failure because of the amount or stated value of common stock outstanding. I was, on the other hand, aware from my studies in investment experience in this natural gas industry that a disproportionate amount of debt and preferred stock capitalization appeared to be a cause of such financial difficulty. I had found that natural gas companies which were in receivership during the period 1931 to 1938, inclusive, had had 79 per cent of their capitalization in the form of bonds and preferred stock, whereas all natural gas companies had only 55 per cent in debt and preferred stock capitalization.

I had found that natural gas operating companies, including those in receivership, had 50 per cent of their capitalization in common stock, whereas those operating companies which went into receivership had only 20 per cent of their capitalization in common stock; that is, 80 per cent in debt and preferred stock.

I found that the operating companies in receiver-
1832 ship had an average bonded debt ratio of 66 per cent,
whereas those not in receivership had a debt ratio of
only 35 per cent.

I, therefore, meant by my reference to bad capitalization the presence of a larger proportion of debt capital than was suitable to an industry of this character and the use of preferred stock, which in my opinion, was not generally well adapted to this industry.

On page 7732 of the record, counsel asked if I meant to state of my own knowledge that rates in New Jersey would be lower today if Mr. McCarter had had a free hand to set rates all by himself without the pressure such as it is of the New Jersey Board of Public Utility Commissioners. I was asked by Mr. Slaff in that connection to concede that rates in New Jersey were lower today because of the presence of a regulatory commission than if there had been no regulatory commission, to which I stated that there were other alternatives that I had in mind which counsel might probably not have. The question was then asked me whether in my judgment the rates would be lower in New Jersey today, other factors being equal, if there had been no public service commission in New Jersey since 1911, to which I answered that I was not in a position to say that that would be the fact. I was told at that time that I could later tell the other things that I had in mind. Had I had an opportunity to explain at that time, I would have pointed out that no one could tell what rates would be under those alternative conditions. Certainly no one could tell now whether rates under local regulation compared with commission regulation would be lower or what conditions under a system of local franchise control might be. Some rates might be higher and some lower. Local regulation would probably make these large uniform rate areas such as now exist in that and other states impossible. Rates in large communities, therefore, might be lower, but, on the other hand, rates in the smaller communities might be higher. I just found it impossible to put myself in the position of answering a question of that sort."

I certainly intended to leave no such impression as that I have appeared here oposing any character of regulation; and if there is anything in the record that validly leaves that impression, I would want to be the first to change it.

Recross Examination Interposed by Mr. Slaff.

I do not believe I am backtracking with respect to what I said in our discussion of investment in Kentucky Utilities as compared with investments in New York, at the time you were cross-examining me. I hope I made it clear at that time—I tried to—that I did not consider Kentucky in other respects comparable to New York, and I am also sure, from the record, as I recall it, I tried to point out that there were many other factors besides regulation which one would consider in making an investment. If that is clearly understood, I think the record is probably satisfactory.

Redirect Examination by Mr. Culton Resumed.

Mr. Booth read from the testimony in the Peoples case a portion of my testimony with respect to pure interest. Since that time I have examined the record in that case and have extracted other portions of my testimony on that subject. I think these portions of that discussion ought to be added, since he made reference to at least a summary of some
portions of the testimony. I would like to have in-
1833 cluded, if I might, the questions and answers given on
page 9269 of that record, beginning with Mr. Booths
question, as follows:

"Mr. Dorau, your conception of the rate of return as you have testified to in this case, consists of the three factors, interest and the risk—

"A. Risk and uncertainty and the wages of management.

"Q. —and the wages of management."

"A. (Continuing.) "You testified before the Commission that the fair rate of return would be about seven per cent?

"A. Yes.

"Q. And of the seven per cent, how much of it is attributable to each of the three items?

"A. The same question— I don't think it is possible for anyone to segregate that in an arithmetic way, such a rate of seven per cent, into the different elements that we have. We think of a figure of three per cent historically as rather representative of interest as such, very often, in a rough sort of way, and build on top of that, the risk premium and the wages of management. There might be a great deal of latitude in the division, but four per cent would cover the risks and uncertainties and such compensation as would be fair and reasonable over that which a passive investment would take, and that seems to me to be the most reasonable figure one could decide on.

"Q. The seven per cent did not include compensation of management?

"A. Yes.

"Q. You said three per cent.

"A. Interest, risk, uncertainty and the wages of management.

"Q. But you said three per cent of the interest—

"A. There is four left to divide among those.

"Q. Oh, I see, is that substantially what you had in mind when you testified before the Commission?

"A. You mean, as a division?

"Q. Yes.

"A. No, I did not— I do not think I attempted— that I attempted to make a division. I know, that back in my mind, the old three per cent is a rather traditional percentage of interest; it may be far from true from time to time.

"Q. Is three per cent far from the truth at the present time?

"A. I think the pure interest element, to calculate in the fair value of a substantial amount of capital, would be higher than the present circumstances indicate. It is fair to calculate it on that basis, but no one, and I, certainly, would not be influenced by the one and one-half per
1834 cent on government financing, any more than I would be, by a yield or price of four and five per cent on what we would consider as risk investments. I do not think it has generally been so regarded. We have neither taken the

extremes, up or down, and from a theoretical standpoint it is very doubtful whether pure interest actually fluctuates as much as we are sometimes led to believe by the market.

"Q. Then three per cent strikes you as being or constituting that part of the seven which would represent interest—

"A. I think it is probably a fair per cent to use for pure interest.

"Q. Now, what part of the four per cent did you allocate to risk or would you allocate to risk and uncertainty, and what part would you allocate to compensation for management or wages of management?

"Mr. Daily: I object to that.

"The Witness: It is a matter of opinion.

"Mr. Daily: It has been answered.

"The Witness: A. It is a matter of opinion.

"Mr. Booth: Well, now, Mr. Daily is not answering these questions.

"Mr. Daily: I am objecting to you asking the question; it has been already answered.

"The Master: He may answer it again if Mr. Booth does not recall the answer.

"Mr. Booth: I have asked him a different question.

"The Master: He may answer.

"The Witness: A. That is entirely a matter of abstract opinion.

"Mr. Booth: Well, what is your judgment?

"A. That is my judgment; that is what I am going to give you. You can appreciate from my previous answers that it cannot be reduced to mathematical amounts, yet you want an answer in those terms.

"Mr. Booth: No, I don't want an answer down to four decimal points. You accountants are accustomed to mathematical precision down to five or six points, but I would like to have your substantial judgment on the matter.

"A. I would be inclined to believe that the return available to capital in an industry of this sort, as a whole, and the type of company performs the work, and so on, that the risk and uncertainty, at any time, over and above pure interest, as pure interest, certainly would reach well to the three per cent level.

"Q. And the remaining one per cent would represent what?

"A. As a residue which we can say is a necessary and

additional inducement as compensation for aggres-
1835 sive capital that has to be managed over passive and inactive capital which does not need management."

Mr. Slaff referred to a portion of my testimony in the Peoples case with respect to price levels and as appears on page 7133 of the record he asked me if I were now a better profit as to price levels than at the time that case was tried, in I believe 1937. I have extracted what I said about price levels at that time from the record in the case in which I was testifying and would like to have incorporated here what I said at that time on this point. The questions and answers I wish incorporated here begin at page 9295 and are as follows:

"Q. You were referring to the positive possibility and you made this statement: 'Possibly only a courageous reversal of Government policies which in recent years have added to the usual abundance of funds in the trough of the depression and during the earlier period of recovery, will prevent such a rise in the price level;' did you so testify?

"A. Yes.

"Q. Has the Government taken any steps towards preventing speculative rises in prices. Has there been any recent steps taken?

"A. It is very difficult to interpret the policies of our present administration. I think the fairest answer to that is that they appear to have done both things, trying to work on both sides. Thus, we have seen the President acting to curb the rise in prices of certain raw materials. The President's energetic pronouncement has some element of threat in it with respect to the rise in the price of copper and such things. On the other side we note an effort to increase the reserve requirements of May 1st, I believe.

"Q. Wasn't that intended for the purpose of eliminating the speculation which—

"A. Well, I would interpret it as indicating a possible state of apprehension or anticipation of a run-away credit inflation.

"Q. Tell me, Professor Dorau, do you believe that it is possible to determine with a fair degree of accuracy, what the general commodity price level will be, well, on January 1, 1940?

"Mr. Daily: That is not cross examination.

"The Master: Is that cross examination, Mr. Booth?

"Mr. Booth: That is proper cross examination in view of the fact that this witness has testified as to what the level of commodity prices are going to be.

"The Master: Just a moment, tell Mr. Daily where it is and he may withdraw his objection. He says it is not cross examination.

"Mr. Booth: This witness testified in response to a question addressed to him by Mr. Daily.

"Mr. Daily: I will withdraw the objection.

"The Master: You may answer, Professor Dorau.

1836 "A. I would not be competent to do it, to make such a statement. Of course, that doesn't mean to say that there are not devices available to us on the basis of which we could make—something better than merely a guess.

"Mr. Booth: Do you know of anybody in this country that can determine with a high degree of accuracy the general commodity price level which will exist on January 1, 1940, and thereafter?

"A. I would like to say something off of the record.

"Mr. Booth: I want this in.

"The Master: Off the record.

"Mr. Booth: Will you read the question?

(Question read.)

"The Witness: A. I think there is just one person in this country who would be in position to do that with a high degree of accuracy.

"Q. And what is his name?

"A. Franklin Roosevelt.

"Q. Would you say that the future of commodity prices is dependent upon a great many factors?

"A. Certainly.

"Q. Would you say that one very important factor would be the policies of the present Federal Government?

"A. Very definitely so."

Recross Examination Interposed by Mr. Slaff.

I did not mean at all that that is all that I testified about with respect to rising price levels in that case. I wanted this to clarify merely the portions that were raised here in this case.

Redirect Examination by Mr. Culton Resumed.

In that testimony at that time, I made no prediction as to what the price level would be as of January 1, 1940, and thereafter. I said on the basis of the evidence then available it seemed the reasonable expectation that we would face a rising commodity price level. I made no detailed study of the price levels to determine what the levels are at this time as compared with what they were back at that time, when I was testifying, but I was interested in the Temporary National Economic Committee's release on December 10, which pointed out that as of December 2, 1939, all commodity prices were 105.3 as compared with August 26, 1939. Raw materials were standing at 108.8 on December 2, 1939 as compared with August 26, 1939. Semi-manufactures were standing at 109.7, as compared with August 26, 1939. Finished goods were standing at 103.5 on the same basis, as of December 2, 1939.

Recross Examination by Mr. Slaff.

No, I did not mean to say that I have read into
1837 the record everything from my original testimony
which we discussed here at page 7133 of this record. I made no statement indicating that. I would not presume to read all of that into the record. I have not read into the record the transcript of those portions of my direct testimony under examination by my own counsel before Master Swissler to the effect that we were in for definitely rising price levels from June 1937 on. I think that is already in the record.

Yes, at page 7133, you questioned me from an abstract of the record in the Peoples case. I did not think it necessary to read into the record at this time what I actually said in the Peoples case in June, 1937, because it is already in the record. I think that part in the transcript was in quotations.

You ask if there is any doubt in my own mind now that in June, 1937 in my testimony before Master Swissler in the Peoples case I testified that we were in for a definitely rising price level. If I may add one more statement as to my recollection of the effect of all that testimony; after making reservations and observations with respect to the difficulties of any forecasting, I said that in the light of the evidence then prevailing that the most reasonable expectation was that we were in for a period of rising prices. That is already in this record. I am not going back on that now. No, it was not my intention to backtrack on that when I read into the record certain portions of the transcript in that case just now. I merely wanted to clarify that rather limited excursion into it.

You ask if from 1937, when I testified, down to September, 1939 this country was in a period of decline in the general price level. I think, if I remember the indices, I don't try to remember them accurately, we had several months of rising prices following the last available figures at the time of my testimony in 1937, and that irregularly since then we have had a slightly declining general commodity price index.

You ask if it is not a fact that after my testimony in Chicago in June, 1937, the wholesale commodity price index went up in one month only, July 1937. I should like to make it clear, we didn't have the data available at that time; I think the lag was two months at least. There was a period of two or three months after I testified, as I remember, in which the prices were rising. That is what all the discussion in this present intervention is about. I think it declined irregularly, beginning with August, 1937, through August 1939. It ended up at a lower level. I don't recall all the statistics, but I think you are probably correct in stating that it did not increase in any one of those months of the two years following July, 1937, over the preceding month. My recollection is there were two or three months in which it continued to go up after that date. At that time there was a reasonable expectation of a rising price level.

You ask if that reasonable expectation did not turn out to be wrong. 1940 is not here yet. Yes, at that time I testified that in the light of circumstances then prevailing it was a reasonable expectation that we were facing a rising price level. That was my judgment at that time. I think it was a reasonable expectation. No, I am not admitting that I was wrong in expressing it as a reasonable expectation at that time. That was my opinion and I do not admit that my opinion as to what did occur was wrong. It has taken longer for certain factors to develop than I then anticipated. I say I am not wrong about the reasonable expectation: I will say that the index of wholesale statistics has not moved in the way it was expected to at that time, if that is what you mean to get at.

Questions by the Examiner.

I made no prediction in June, 1937. My testimony
1838 related simply to my opinion which was not primary
testimony on my part, either, that in the light of circumstances then existing, in the light of apparent development of trends, it was the reasonable expectation that we were headed for a higher price level. I think the questions were directed at the wholesale commodity prices. I believe that is right.

Recross Examination by Mr. Slaff Resumed.

When you suggest that I held out to the Master on which he might form an informed judgment with respect to how wholesale commodity prices were going in the next year or two or three years, I think you misinterpret the whole matter of forecasting, Mr. Slaff. It was not how it was going to go, but what was the reasonable expectation as of that time. No one can state at any given time what the price level is going to be in three months or six months. If that were the requisite, there would be no sense in making that sort of an estimate or forming that sort of a judgment. All we can do is to give our best judgment. Up to the middle of this year, or the fall of this year, that rising trend had not developed as anticipated. A decline of some seven points in the index is shown. It may be somewhat more than seven. The index speaks for itself.

You ask if it is not true that even with the rise which has taken place since approximately September, 1939, we still today are not at the price level of June, 1937. Not of the all-commodity price level, that is true. I would like to add if I may so there is no misunderstanding, I did not presume to put everything in the record that bore on that question. I merely wanted to get in certain aspects that would explain the circumstances and the limitations on which that observation of a reasonable expectation was made. I wanted to add these excerpts to provide a little more background for the interpretation of the brief thing that was taken out of the abstract on my former examination.

Question Interposed by the Examiner.

You ask if I am quite satisfied with the statement as it appears in the record, subject to whatever limitations I have just made, that I did testify in June 1937, that in my opinion we were facing a definitely rising price level in commodity prices. Yes, with the exception of the fact that all of the testimony I think is clearly indicative that I was expressing it as a reasonable expectation at that time.

1839 (December 14, 1939.)

Redirect Examination by Mr. Culton Resumed.

In my cross examination some questions were asked with respect to the amortization period of defendants. I have made no attempt to determine what should be a proper amortization period for defendants. I have made no estimate as to what that period shoud be. My testimony was not based on the assumption of any particular period. I assumed that would be determined as the most reasonable possibe estimate in the light of all of the evidence available. After the Commission shall have used its best efforts and determined as best it can what a proper amortization period would be there still remains the hazards connected with the amortization period.

Coming to an estimate, no matter how admirable it may seem at the time, does not remove the risk involved; because making an estimate does not establish the certainty; and the making of an estimate does not reduce the risks that inherently exist. Checking the elements of risk and uncertainty is just a step in measuring and appraising the value of the risk.

I do not believe the investor necessarily avoids risks, but what he is interested in is whether the return possibility is compensatory for the risks and uncertainties involved. I don't think it matters much as such who makes the estimates. It does matter whether the investor thinks the possible rewards are worth the chance that he sees in the situation.

I don't believe that either a public or a private opinion as to what is likely to happen necessarily predetermines or necessarily imposes any restraining conditions on what nature, for example, is going to do, or what the operations of the economic forces are going to do. The most reasonable provision for amortization is not necessarily accurate. It can't be assuredly accurate, because no one can foretell the behavior of natural forces, or for that part, of economic change. All that can be done as to expectations, as with the price level, is to make the best estimate in the light of the circumstances then prevailing. The conditions on which the estimate is made may change radically. They may even change quickly; and it is that possibility that the investor keeps in mind irrespective of the estimates made.

You ask what risks or hazards would be left to be considered by investors after the Commission has exercised its best judgment as to the proper amortization period. I would not assume to take the position of an engineer or geologist, and never have; but it seems to me that to investors there are remaining hazards as to what the possible withdrawals from a given field of this sort might be, as compared with past withdrawals; what the rights of carbon black utilizers might be or might come to be in a field of this sort; what natural accidents underground and other developments there might be. Any one, at least any one acquainted with gas in the least way, understands that such things can happen without any warning.

1840 The rate of withdrawal probably would appeal to the more informed investors as a possible factor influencing the availability, that is, the cost at which natural gas might be available. If he should be more widely read, he might even be concerned about the possible new uses for natural gas nearer the points of consumption, such as a basis for a new chemical industry.

He may even be concerned about public proposals for the proration, or assignment, rather, of the various fuels to various categories of use which might interfere. I don't mean to imply that he is necessarily in a position to accurately and technically appraise the possibilities of that; but he is influenced by any knowledge he may have as to these uncertainties, which no one would be in position to forecast accurately.

You ask if there is any way that the Federal Power

Commission could protect an investor against these remaining risks to which I have referred. Well, that is a broad question. I assume, theoretically there are some possible ways; but as far as I understand the present rules and practice in regulatory procedure, the Federal Power Commission can't assume to protect investors against that sort of thing.

I don't understand that any governmental agency offers to reimburse investors for any experience they may have which is worse than anticipated in any of that type of estimate. A regulatory commission can, of course, in the future increase its own estimates if it has found it has been too conservative; but I don't understand that there is any principle according to which the Commission can retroactively reimburse in case it finds it is wrong on the other side.

In my direct testimony I tried to explain what the investor believes is compensation for the risks involved as he sees them. I might add that he may be relatively ignorant, or relatively well informed, but the thing of practical importance is how he behaves towards this situation in the right of whatever information he may have.

In my cross examination there was some discussion about control of markets. I stated that one of the risks of defendants was that they do not have control of their markets. I used the term "control of market" in the sense in which it is used in public utility literature, when we say that a public utility has control of its market. That is, it is engaged in the distribution business; it has direct access to the customers; it is in position to determine the marketing and merchandising policies. It is in position to determine how much exploitation of incremental or marginal business it is appropriate to go into; in other words, simply the contrast between a company which occupies an industrial and business situation, where it can deal with its market, as distinguished from a situation where it is insulated from its market as a wholesaler is. I would like to say that there was no invidious implication in the word "control", such as might be derived from anti-trust literature or anything of that character.

In my opinion it has been rather generally accepted as a good principle of organization in utility industries to
strive to integrate the production of the service, the
1841 transmission of the service and the distribution of
the service. And the history of the utility industries,

of course, most strikingly the electric industry, is in harmony with that principle. The number of isolated stations is relatively rare. Isolated power plants and isolated transmission lines are not, so far as I know, looked upon with favor by the investor because he does not feel, whatever their arrangements might be, that they are as good or as stable or as reliable as integrated ownership, where the community of interest is completely established.

When I stated that the defendants had no effective control of their markets I meant they were not in the public utility distributing business. They might have a degree of veto of some aspects of marketing policy but they were in no position so far as I know positively to direct or determine what the marketing policy should be with respect to the general distribution of their product.

You ask what I meant in my testimony about the risk incident to the load factor employed by defendants. Well, my understanding is that the property of defendants is being utilized well up to capacity; that in fact it is operated at times over 100 per cent of the stated or rated capacity of the line. Under those circumstances the outlook for increased business or improved utilization, economies or gains from improved utilization would not be very good as compared with the situation where it was operating, say, at 60 to 70 per cent of capacity; and there was some outlook that defendants might take advantage of the unutilized capacity and do a larger or more compensatory business. The risk, therefore, is that in the development of the future with respect to an enterprize operating at nearly full capacity, it might find itself operating at lower capacity, but rather improbably operating at higher capacity.

In my discussion of the risk arising from the possibility of raiding lines I did not undertake to say where those raiding lines would come from. I was trying to reflect the investor's reaction to the possibility of some one offering to bring gas to the Chicago market at a lower price than is now being offered; because some one might be able to bring it under more advantageous conditions, or from more advantageous locations. The possibility of such a thing is what was in my mind, because if some one offered to bring gas at some lower price to the Chicago market it would create an embarrassing situation which I believe would ultimately tend to force the existing company to give regard to the price level at which such gas was offered.

As a practical matter, in the instances where lines have been built to markets or territories, I recall, by natural gas pipeline companies, it has caused some disturbance or concern to those local markets and they would tend to be forced to capitulate to the most economic price at which gas would be available.

I think I had in mind the possibility that if gas were offered at a lower price to the Chicago market that regulatory commission authorities might well bring pressure. It is not inconceivable that a local distributing public utility company might be asked to point out why they should continue to pay as high a price under an exist-
1842 ing contract when gas actually was offered at a lower price, if an arrangement could be made.

Presumably, if my understanding of the law is correct the Commission has control over the necessity of operating expenses, and the price paid for gas presumably might come within the powers of the Commission. Whether that would break such a contract I am not in position to say. If such a company had to bear the burden of paying the price and couldn't recoup for it the chances are it might some day find itself in financial embarrassment and might find some other legal relief from the burden of such contract.

I didn't presume to make any determination as to exactly what the probability was legally, but simply stated in my opinion in the light of those circumstances that was something the investor, if at all informed about the situation, might give consideration to.

I was asked on cross examination what other fields there are from which gas could be obtained to support a raiding line into the area of defendants' markets. I am not a geologist, as I have stated. I think an investor is rather impressed nowadays with the fact that gas is being found here, there and somewhere else. He may know that Nebraska brings some in or that Southern Illinois brings some in. He is rather getting the idea, in my opinion, that gas might be found most anywhere after a while. So far as my general knowledge goes I have the impression that gas is being found in an increasing number of states and over a wider area. I don't mean to say I know where this gas is going to be found. I don't know that.

If I did know I would probably do something about it. All that the investor is concerned with is that somebody might find gas closer to the market served by defendants.

In my cross examination I made a distinction between incremental business and marginal business of the natural gas company. By marginal business I mean, I think it is the general meaning, that business which is just sufficiently compensatory to be worth taking on. It is the last class of business or the last portion of a class of business which is just worth while for an enterprise to assume to take. It is the business for which cost and income are just in balance. The company would not go any further. It finds it probably worth while only just that far.

By incremental business I had in mind any business which could be taken on additional in the light of the capacity of the property, in the light of the circumstances of the market and in the light of the market already served, at an advantage over and above what the marginal business would yield; referring, therefore, to any additional business. There is no implication in incremental business that it is just compensatory or that it is a burden on any other business, simply a reference to additional amounts of business which could be taken on to advantage. Marginal business would be that business which is only just compensatory.

In my prior cross examination reference was made to the fact that some of the risks which faced defendants in 1931 have been to some extent overcome. You ask if
1843 I think that having in part overcome such risks the investor should be deprived of the fruits of having successfully overcome them. No, I don't believe you can with impunity deprive the investors in any industry of the necessary compensation for the assumption of the risks peculiar to the initiation or early periods of a business enterprise. It is one of the most important risks which he assumes and he expects sooner or later to be compensated for it. In a competitive non-utility enterprise he looks to the time when the business is established as a going concern, at which time he figures the risks in initiation and origination will be over and he will be making a return which will compensate him for his earlier risk assumption. I believe I did testify I did not consider that question ought to be allowed to enter into the rate of return calculation.

I have always felt it was more appropriately given consideration in the determination of going concern value, the value of a going business over and above the value of an enterprise just physically and legally established.

The record at page 7013 shows that during my cross examination I testified in substance that a consideration of the advantages of a given industry is a part of the mental processes of an investor in making up his mind as to the return required by him from a specific industry or a specific company. I added, however, that he could do that in two ways, one of which was by weighing the advantages of the particular industry or particular enterprise against the advantages or disadvantages of another industry or another enterprise.

I said that because I was of the opinion there is no absolute measure of risk and uncertainty; that the determination of risk and uncertainty is a relative matter. The process by which it is arrived at is comparison. I would like to have said at that point that comparisons may be made with respect to a given industry either by reference to a group of industries which by more or less common consent are considered to be more risky, or by reference to a group of industries which are considered by more or less common consent to be less risky. I prefer to begin my comparison with the utility industry which I consider to have involved in it generally less risk and hazard. I prefer to begin with the utility industry, because compared to other industry segments, I feel I know a good deal more about the risks of the utility industry. Also, it appealed to me as the natural and logical thing to do since there appeared to be some implication in this case that the utility status was being prepared for this particular enterprise.

I would say I think the expression probably speaks for itself. What I meant to say was from what I had read of the record in this case and the complaint, what I knew of some people's interpretation of the legislation, it appeared to me that the procedure was going to be that of trying to show that this industry was to be regulated as a public utility industry is regulated, and if that were the case, or if there is any good reason for that at all, it was a perfectly logical thing to start your comparison with the utility industries and think in terms of what additional risks there were in this enterprise as compared with the more commonly understood public utility; entirely practical without any implication as to the merits of the case from a legal standpoint.

1844 I stated on page 7018 of the record that I did not believe it would make any difference in determining the proper rate of return whether a company was capitalized on an all-common stock basis or on a basis of 50 per cent first mortgage bonds and 50 per cent common stock. I believed it was true because I never had the understanding that a public utility is under the legal obligation to go into debt in order to get a fair rate of return. It was my opinion that the fair rate of return should compensate for the necessary supply price of capital at the most advantageous capital bargains that could be made at the time.

As to what the advantageous bargains are that can be made at one time is often a question on which there is a great difference of opinion, some people believing that a long term obligation is advantageous issued at one time, and possibly others differing. When the management makes the decisions as to that, it assumes the risk that it may be wrong at some time in the future. I have always been convinced there is nothing appropriately in the regulatory process that makes it right and proper for public authority to impose on consumers any burdens arising out of the nature of the capital bargains which different classes of security holders may have made among each other and that, conversely, if the hazard that a given capital structure prove disadvantageous at some time in the future is assumed by the equity capital, for example, that should it turn out advantageous in the future, there is no one who more appropriately might have that little differential of reward than those who took the chance of its turning out disadvantageously, namely, the equity ownership.

At page 7038 Mr. Slaff asked me if I had the ratio of bonds to the total capitalization of the Northern Natural. To the best of my information there is about 39 per cent bond indebtedness without giving consideration to surplus. I think the company has something of a surplus, so the ratio is probably something around between 37 and 39 per cent for an average 42-year maturity. If the surplus was considered it would be down to 37, and without giving consideration to the surplus I think it is 39.

At page 7039 Mr. Slaff asked me whether or not I could give the bond interest coverage if defendants issued bonds for 40 per cent of the capitalization of the company, carrying coupons of 3.25 per cent. You ask if I can now give that information. I believe I indicated that I was unable to make that kind of a calculation because I did not know what the rate base of all of the property would be.

I had in mind, of course, the distinction between establishing a ratio on the basis of the capitalization that a given company happens to have and a ratio on the basis of the value of the property. There is no necessary assumption that capitalization reflects the value of the property. Consequently, some concern may have a modest amount of debt, only a modest amount of stock, and carry a very substantial amount of surplus. It might choose to state its common stock at a nominal figure on the balance sheet; thus there is no necessary parallelism between the capitalization and the value of the property.

1845 You ask if in computing times interest coverage it is ordinarily the custom of the investor to use capitalization based on the fair value. When they are trying to discover the coverage of a particular issue, the question does not arise because they take the bonds and the interest on the bonds and the income available for that particular issue, but it is only when they are trying to relate times interest coverage and debt ratio to rate of return that the effect of a possible difference between capitalization and value would have an influence on such calculations. A company, to make it very simple, might show a 40 per cent debt ratio to a formal capitalization but might have only a 20 per cent debt ratio to the value of the property.

I think I stated in my testimony that one normally makes calculations of that sort. I do from time to time. I carried some out further. If you wanted to assume, for example, that a concern had a 40 per cent debt to value ratio, that it was able to finance 40 per cent of the value by debt capital, and that the interest requirements on the bond issue would have to be covered five times, let us say, just for illustration, then it could pay as much as four per cent for its debt capital and maintain those ratios. That is, a 40 per cent debt ratio, and a five times interest coverage would allow four per cent interest cost on 40 per cent of your investment. And incidentally, if you had a 40 per cent ratio with interest requirements covered five times, the equity, the remaining 60 per cent, would at an eight per cent rate of return earn 10.67 per cent. Those are purely arithmetic relationships.

That example would be pertinent to any rate base that might be used. It is not necessary to know that it is sixty million or sixty-three million or seventy-five million. It can be calculated simply on unity or one hundred. Take one hundred and have 40 per cent of the one hundred as debt and earn the interest requirements on forty dollars out of the one hundred five times over; you could pay as much as 4 per cent and have five times coverage. The remainder would earn at an 8 per cent rate of return 10.67 per cent. That can be calculated for any possible or any conceivable relationship.

In my cross-examination there was considerable reference to the statute of New York with respect to legal investments for savings banks and trust funds. One paragraph of the New York statute, Section 13, was offered in evidence. Subsection A of Section 13 reads as follows:

"(a) Such corporation shall have all franchises necessary to operate in territory in which at least 75 per cent of its gross income is earned, which franchises shall either be indeterminate permits or agreements with, or subject to the jurisdiction of a public service commission, or other duly constituted regulatory body, or shall extend at least five years beyond the maturity of such bonds, and such corporation shall file with the superintendent of banks and make public in each year a statement and a report giving the income account covering previous fiscal year and balance sheet showing in reasonable detail the assets and liabilities at the end of the year."

1846 As I stated on page 7050 of the record it is my understanding that "supplying" as used in Section 13 in the statement "business of supplying electrical energy or artificial gas or natural gas purchased from another corporation" referred to distribution of public utility services at retail. That was my interpretation of the statute in response to questions by Mr. Slaff on cross examination. I had that meaning of the work "supplying" in mind when I answered those questions.

In my cross examination Mr. Slaff asked some questions with respect to the individual enterprisers and the corporate enterprisers. I meant to make no distinction between individual and corporate enterprisers.

At page 7071 I was asked if I had not made the statement, "The gas and electric industries are characterized by decreasing costs, increasing returns, and thus the possibility of lower prices to the consumers." In my judgment there is a difference in the cost behavior of the electric industry and a concern of the character of defendants. That distinction is, I believe, quite obvious if one understands the nature of decreasing costs and increasing returns.

The most generally accepted meaning of the phrase "decreasing costs and increasing returns" refers to that circumstance in any given enterprise which arises out of the fact that its full capacity for production might not at any one time be fully utilized; and therefore, any incremental business can be carried at lower unit costs, because the fixed overhead and common costs of such an undertaking have already been taken care of; and thus any increase in the volume of business up to the point of full utilization would, assuming a constant price for its product and an unchanged cost level, result in a lower unit cost for the service or product of that enterprise. It is quite possible that any enterprise which has unutilized capacity could experience decreasing costs and increasing returns if it got more business.

That behavior has been particularly evidenced in the electric industry because in the electric industry the capacity has to be capable of meeting the peak load demand; and consequently any additional business which you can get at off peak hours can be taken on to great advantage; but once the total capacity of a plant is reached that kind of decreasing costs and increasing returns is no longer available.

I don't think there is any probability that that cost behavior to which I have referred such as has been experienced by the electric industry would apply to defendants. If I am correctly informed, this enterprise has been operating nearly at full capacity, and consequently there is apperently no basis for a decreasing unit cost experience of that sort.

Moreover, it does not seem to qualify on the other two assumptions which are always necessary, namely, that the level of cost experience as such remains unchanged, and that the revenue rate remains unchanged.

Here you are dealing with natural resources, a situation which affords every reason to believe that increased costs per unit of raw material will develop in the future.
Consequently, you have no opportunity for the aforementioned type of decreasing costs; and there ap-
1847 pears to be reason to believe that there will actually
be increasing costs insofar as the circumstances under which the raw material is to be provided are as I assumed they were.

In my cross-examination some questions were asked me with respect to the earnings of defendants and their depreciation or amortization. Clearly, I have not endeavored to ascertain the value of the properties of those companies, their earnings or the proper amounts of depreciation or amortization. I was interested only in the question as to what the ratio of the return ought to be to the rate base. I am not in position to determine the value of the rate base, nor to appraise the validity of the operating expenses and thus determine the return in dollars.

On page 7170 of the record it appears that the Examiner asked whether I had the figures on the Northern Natural Gas Company with respect to its revenue and the sources from which it was obtained. I attempted to obtain those figures and so far as I know this is the best form in which they are available. As of the twelve months ending June, 1939, the revenue from domestic sales made directly or through subsidiaries of this company was $1,006,942; for commercial, $615,258; and for industrial, $2,909,681; making a total sold directly or through owned subsidiaries of $4,531,881. Town border sales are reported at $6,029,586 which should add up to an overall total of $10,561,467. I obtained these figures from Mr. Gilman who had received them from some insurance company. I asked him if he would give them to me from reports he had. My only interest in bringing in these figures is that the Examiner asked me about it. I haven't checked these figures with the companies and can't assume any responsibility for them; it is my understanding that those are the figures that the insurance company got.

Questions By the Examiner.

The MCF figures in that connection were: For domestic, 1,493,320; for commercial, 2,053,272; for industrial, 18,721,922; or a total of 22,268,514 sold directly. The total town border sales aggregated 24,876,729 MCF, making a grand total of 47,145,243 MCF for direct and town border sales. That is the best information I was able to get. I could not find it in Moody's.

Redirect Examination by Mr. Culton Resumed.

I recall reading the examination of Mr. Emery with respect to an exhibit which he offered in the Chicago District Pipeline case relating to comparative yields on bonds, preferred stock and common stock in the ratio or 1, 1.1 and 1.4. I tried to acquaint myself with it and I believe I understand the formula he employed. If that formula be properly used it is probably a satisfactory device for use in determining a proper rate of return, but if such ratios are going to be employed against, let us say; an average bond yield, all of the elements used ought to be brought up to date as of one time. Averaging the base of bond yields after bringing them up to date and then applying a multiplier as of some particular date, does not appeal to me as being a reliable and valid statistical procedure.

1848 The relationship between those different classes of securities or the spread of relationship between them might very well change in the companies which were used to determine such ratios. It might be different from one time to another.

If I can just use an illustration I can possibly explain it. It is possible that in tabulating a list of companies of that sort you may have a company which had only preferred stock, no debt, and common stock; and the preferred stock may be in a very good position and have a relatively low yield. The next company you might take might be one which had a very high ratio of debt or little or no preferred stock and the rest common stock, and so on down, with any possible type of combination. Consequently, it is mathematically possible that within the preferred stock there would only be the best preferred stock, that within the bonds there would be bonds of very high debt ratios and consequently you may come out with an overall summation of 1.1 for the preferred stock yield compared with the bond yield. In fact, it is arithmetically possible, using that device, to come out with less than 1 ratio for the preferred stock. Consequently, unless you determine all the relationships and their validity at a given time, and check on that, I would say that that method might be unsafe.

The change in the corporate structure of such companies as are considered during the period of years changes the relationship between the different classes of securities. That is so especially in this industry where securities are issued under very heavy retirement requirements; seven or eight years later might show a much smaller proportion of bonds outstanding than at some earlier period. I think it is a very dubious statistical procedure.

Mr. Slaff asked me how many bonds I had used in my exhibit which were not rated by Moody's and which were privately held. I tried to ascertain that for him and found twenty out of the list I had were privately held. I would like to say, however, that I am not privileged to assume that the rating services never rate privately held bonds, or what the reason is why they do not rate them. They refused to commit themselves with me on the matter, so I must go on the assumption that since they were privately held that the reason is they would not be given any rating. That is all I can do.

Recross Examination by Mr. Booth.

If I were running a company it doesn't necessarily follow that I would provide for capitalization in relation to its fair value. What I was speaking about, of course, was formal capitalization. I want to get that clear. You ask if as an economist it is my notion that economically it is sound and proper to set up a capital structure with no relation to its fair value. No, as a practical matter it rarely develops because we have the surplus item to which I referred; and there is no practical necessity for making continuous readjustments in formal capitalization. What I pointed out was that the dividing line between formal and informal capitalization is less easy to distinguish with the introduction of no par stock, and the liberality with reference to stating the value of no par stock, and the possibility that capital is largely reflected in surplus.

1849 I think there are times when a company's capitalization ought to be brought in line with the facts disclosed by appraisals or reproduction cost appraisals of engineers. There are times when they are justified in readjusting the capitalization upwards in accordance with the facts. No, I do not think that the capitalization ought to be increased merely because an engineer states that the reproduction cost is $25,000,000 higher than the investment in the property. I don't think that would be sufficient evidence; but when a management is firmly convinced and the facts have been established over an extended period of time that there is a wide disparity, I see no reason, given perfect information and making a perfectly clear statement as to what it is doing, why it might not be adjusted.

If under those circumstances there has been a sharp decline in prices and the engineers determine a year later that the reproduction cost is $25,000,000 less it would be no different than if the value of the property a year after its inception gets out of line with its capitalization.

Yes, I testified in the Peoples Gas Light and Coke Company case.

1850 S. E. CAMPBELL, a witness for defendants, called for recross examination, testified:

(December 14, 1939.)

Recross Examination by Mr. Booth.

I am Secretary of Natural Gas Pipeline Company of America. I am somewhat familiar with Exhibit No. 136 presented by Mr. Miller in this case which is the earnings statement of defendants. That exhibit was prepared by Mr. Miller under my general supervision.

Page 1 of this exhibit is a statement of combined profit and loss of defendants for the years 1932 to 1938, inclusive. Column 7 shows the combined profit and loss of the two companies for the year 1938. Included in that column under the caption "Other Charges" is an item for depreciation in the amount of $1,978,408.31. That depreciation figure is made up of various percentages applied to the different groups of the plant account.

You have shown me a sheet headed "Depreciation Expense Year 1938 for Natural Gas Pipeline Company of America" which you state was taken by your accountants off the books of that defendant. That sheet shows the depreciation rate as used by that company for 1938 was 4 per cent with respect to Account 1002, rights of way; Account 1005, main lines; Account 1006, compressor stations; Account 1008, telephone system; Account 1009, meters and regulators; Account 1010, other main line structures; Account 1011, branch lines to distributors. That is the rate which the company used in 1938 for those classes of property, in computing the depreciation for those properties.

That sheet shows that for Account 1013, tools, the depreciation rate was 20 per cent; for Account 1014, general laboratory equipment, the rate was 10 per cent; for Account 1015, automotive transportation, 25 per cent; and for Account 1016, furniture and fixtures, the rate was 7.5 per cent. Those percentages were related to the average book cost of the company contained in the various accounts for the year.

There is a difference between the rate of depreciation applied to the properties of Texoma Natural Gas Company and to Natural Gas Pipeline Company of America for the same classes of property. I don't know whether I can recall all of the rates applied in depreciating Texoma's properties. I do know that compressor stations, for instance, are 6 per cent. I believe main line is 2.5 per cent; gathering system, I believe, is 2.5 per cent; automotive equipment is 25 per cent; gasoline plant is 10 per cent; furniture and fixtures, 7½ per cent; laboratory, 10 per cent. I don't believe I can recall the others. Those are the major items, however. Those percentages are related to the average book cost for the year. There is no change in the percentages applied to Texoma's properties for the year 1939.

Yes, I am familiar with the fact that the Federal Power Commission has recently promulgated a classification of accounts for natural gas companies. I don't believe I
1851 can state that that classification of accounts provides
for the computing and the determination of annual depreciation expense in relationship to the book cost of the company's property. I don't know. I don't believe I can answer this question because I haven't studied it thoroughly yet. I have a copy that has been turned over to the men in the accounting department. I haven't made a thorough study of the classification as yet.

I was present at the hearing before the Federal Power Commission in connection with this proposed classification of accounts. I did not make a personal appearance. The defendants were represented by their attorney, W. A. Daugherty. I would say the company was given an opportunity to make objections to the proposed classification of accounts prior to the time it was promulgated. Our company officials did not discuss the position the company would take with respect to that classification of accounts. We left it up to the attorney, who was working through an A. G. A. committee. It was left to that committee to make the objection and we permitted our companies to be included in the group objecting. So far as I know the company never suggested that the determination of annual depreciation expense should be computed on the basis of value of the companies' property as distinguished from book cost in connection with this proposed classification of accounts for defendants. As far as I know defendants never suggested the annual depreciation expense be computed in the classification of accounts on the basis of reproduction cost. So far as I know defendants never suggested that the item of going value be allowed for or be amortized in the proposed classification of accounts.

Redirect Examination by Mr. Hedrick.

I stated that W. A. Daugherty represented our companies at that hearing in Washington. Mr. Daugherty is a member of the board of directors of the Natural Gas Pipeline Company of America. He is attorney for the Standard Oil Company and he represented the A. G. A. committee at that hearing.

Recross Examination by Mr. Slaff.

That was an industry committee presenting the views of the industry to the Federal Power Commission with respect to the proposed system of accounts.

Recross Examination by Mr. Booth Resumed.

You ask how the items of depletion and retirements for 1938 included under the caption "Other Charges" on page 1 of the exhibit we have been discussing were arrived at. The depletion is arrived at by taking the amount of gas under each acre at the beginning of the life of this project which was, as I recall, estimated at 12,000 cubic feet. I would like to be able to check that, though, in case that is wrong. Taking as a factor the book cost of the acreage we arrive at the depletion factor for each unit of gas taken out, whether the unit is M. C. F. or a cubic foot, as you might determine, and that factor is applied to the acreage on the books by months. That estimate of 12,000,000 cubic feet per acre was made, as I recall, as of 1931.

1852 The item of retirements is the difference between the book cost and the depreciated value of the items retired less any salvage value. In other words, if we have accrued less than the book cost of an item of property, when that is retired there is charged to retirement expense the difference between the accrual and the book cost of the property less salvage. Stated another way, it is the undepreciated portion less the salvage value.

Questions by The Examiner.

You ask how we arrive at the depletion factor. You have a total reserve; your production divided by your total reserve gives you the ratio or the factor. The factor changes from time to time as the acreage changes and it changes each month with the amount of the production each month. The factor changes every month and as the acreage increases or decreases the total reserve changes or decreases. That actually changes the figure every month. Yes, I meant there when I was talking about changes in our figures that the factor would change from month to month and consequently our monthly, and finally, our yearly figures for depletion would vary from year to year or from month to month. That is, the financial figure would vary.

You ask how these depreciation rates compare with past depreciation rates used by the company. On Texoma they are the same. On the Pipeline they are a little higher than we had in the earlier years. The change was made in 1938 when the depreciation rates were increased.

(At this point argument was had on motion for interim order before the full Commission in the hearing room, Hurley-Wright Building, 1800 Pennsylvania Avenue, Washington, D. C., at 10:00 O'clock A. M. on December 18, 1939.)

1853 **ROBERT H. DELAFIELD**, a witness for defendants, called for redirect examination, testified:

(January 8, 1940)

Redirect Examination by Mr. Morgan.

I testified in this case about Saturday, October 28, 1939. I have gone over the transcript of my testimony for the purpose of determining whether or not I have any corrections that I wish to make in the record. There are a few typographical corrections and those, I believe, have already been turned in to the reporter. There were the following errors:

On page 6710 to 6712 I testified about a high pressure line in New York State belonging to a subsidiary of the Standard Oil Company and running north and south across the Pennsylvania-New York line. I was in error and had that line confused with a high pressure line belonging to the same interests running from Pittsburgh to Charleston. The line in New York State is not a high pressure line.

In page 6778, lines 15 and 19, 20 and 21, either I was confused in testifying or the record is confused in words. There are none of them particularly important.

In line 15, the words "small section of" should be stricken. At that point I was testifying about the Seaboard line and said it was only a small section of pipeline. It is a large section.

The next answer reads on the record this way: "One is a distribution company, one is a transmission company, one is the Amere Gas Company. I am sorry, that is wrong. It only has two subsidiaries now, I think. One of those companies has been dissolved."

That is an error, and the answer should read: "Two are distribution companies, one is a transmission company and one is the Amere Gas Company." That "I am sorry, that is wrong" and the rest of that answer comes out. There are three subsidiaries, the Amere Gas Company is the third subsidiary.

On page 6780—this is a very minor—line 23, I say that Bracken County Gas Company is a land owning company. It is not; it is a distribution company with about a hundred customers, a very small company.

Now, beginning at page—I am sorry that I have not got that page, where Mr. Slaff's calculations begin on the rate of return—I think it is on page 6777 and from there on there are numerous calculations on rate of return, and I think it was agreed, or so I understood at that hearing, that I would accept Mr. Slaff's calculations for that purpose. In checking them over, I find no errors of real importance, most of them being in the second decimal place, but I thought I would give you the check.

In my cross-examination Mr. Slaff asked me a great many questions concerning a document which our company had filed with the Securities and Exchange Commission in which the earnings of a number of subsidiary companies of the Columbia Gas & Electric Corporation were
1854 brought out and discussed. I believe that the average earnings of those subsidiaries was some 3.52 per cent as stated by Mr. Slaff and to which I agreed in substance. That document and my testimony concerning it is dealt with in Mr. Slaff's first brief in this case and is referred to as an indication that notwithstanding these low earnings Columbia Gas & Electric Corporation expects to refinance some $90,000,000 or $100,000,000 of indebtedness at a rate more attractive than the present rate.

Columbia Gas & Electric Corporation has at present approximately $104,450,000 of 5 per cent debentures outstanding. The financing that we contemplate is to refund those with an issue of approximately $90,000,000 of debentures in a different form. The difference is to be made up from cash.

This 3.52 per cent average earnings of the subsidiary companies referred to in that document is based on the earnings for the year 1938. The latest earnings that I have available are for the 12 months ended November 30, 1939, and they are substantially higher than the earnings for the 12 months ended December 31, 1938. For the year 1938 the gross revenues consolidated of the Columbia System companies were $92,968,000. For the 12 months ended November 30, 1939, they were $99,264,000, an increase of approximately $6,000,000. The per cent increase was 6.2.

The gross corporate income for the year 1938 was approximately $21,500,000. For the 12 months ended November 30, 1939, it was $24,500,000, an increase of approximately $3,000,000, or 14 per cent. After the payment of all interest charges on a consolidated basis, the income available for the stocks of the Columbia Gas & Electric Corporation in the year 1938 was approximately $10,300,000, while for the 12 months ended November, 1939, it was approximately $13,065,000—an increase of $2,752,000, or not quite 27 per cent.

Making my calculations here on the stand, which are necessarily approximate, the figure that would correspond to the figure of 3.52 would be approximately 4.25 for the year ended November 30, 1939. The divisor is approximately $578,500,000 to be divided into $24,700,000 approximately.

Questions by The Examiner.

You point out that with respect to 1938 the gross corporate income there is $21,500,000 and I use for the November 30, 1939, rate return result $24,700,000 which corresponds to the $24,500,000 gross corporate income which I gave for the 12 months ended November 30, 1939. You ask why I use that figure which corresponds to the $24,500,000 rather than a figure which would correspond to the $19,655,000.

I think that those two figures do correspond. The difficulty is this. I am working here from an operating report. Mr. Slaff had worked from a report to the Securities and Exchange Commission on a little different form, and as you go down the statement, the figures change in the statement, but not the final result. There are figures within the statement which I have had to add and subtract, but they come to the same thing.

1855 Let me give a final measure of the increase by saying that the very lowest figure on the statement, which would be exactly the same in either Mr. Slaff's statement or this statement, shows earnings available for stocks of the Columbia Gas & Electric Corporation for the 12 months ended November 30—I beg your pardon—for the common stock of Columbia Gas & Electric Corporation, for the 12 months ended November 30 of $6,605,000-odd,—an increase of $2,752,000 over the preceding 12 months, that is, the 12 months ended November 30, 1938, because I have not available to me here the 12 months ended December 31, 1938. These figures will not correspond exactly, because I am making a comparison with a 12 month period ended November 30, 1938, and while the relationships will be the same, the exact dollars wont.

Yes, I know what that $19,655,000 is. It is the gross corporate income on a consolidated basis for the year ended December 31, 1938. The 1938 figures I have just given in the record are not the year end figures but the November 30 figures because that is the only way I could compare them. The relationships will be the same, but the exact dollars wont.

Redirect Examination by Mr. Morgan Resumed.

If we were refinancing the present value of the consolidated properties, which we will assume to be $578,500,000, between 1[illegible] and 16 per cent of the total valuation would be represented by this contemplated bond issue of $90,000,000. I think to make this statement perfectly clear I might read into the record a tabulation of the consolidated capitalization of the system and relate it back to earnings that way.

These figures are as of December 31, 1938, in order to correspond with the previous testimony. At that time the Columbia system had outstanding the following capitalization:

"Subsidiary Bonds	$79,167,000	16%
"Subsidiary Preferred stocks and minority	50,180,000	10%
"Columbia Debt	104,450,000	21%
"Columbia Preferred Stocks	110,101,000	22%
"Columbia Common stock, surplus, etc.	155,116,000	31%
"Total	499,014,000	100%"

That was the capitalization of the Columbia Gas & Electric Corporation and its subsidiaries at December 31, 1938. It had income for that year to support that capital structure of about $21,635,000, and the charges on the subsidiary company debt, preferred stock and the very small minority plus the interest charges on the Columbia Gas were $11,404,000 approximately. So that on a consolidated basis, the system earned all of its charges prior to its preferred dividends, about 1.9 times. That is looking at the picture in the worst way.

If you consider only the Columbia Gas & Electric Corporation itself, it had for the year ended December 31, 1938, gross corporate income of about $14,273,000, and its interest charges were—that is, interest charges on long term debt—were $5,228,000, so that it earned its interest charges almost three times.

1856 In qualifying and saying "interest charges on long term debt," I want to make clear that there was no short term debt, but there is interest on reserves and things like that.

In addition to those facts, Columbia Gas & Electric Corporation owns natural gas subsidiaries with gross fixed property and the figure that we were using in the cross examination was approximately $400,000,000. Those assets have against them only $10,500,000 for subsidiary debt. Adding that to the Columbia debt of $104,000,000-odd you get $114,950,000 of debt against the properties with a gross book value of $400,000,000. Those are only the gas properties.

Columbia, of course, owns in addition, 100 per cent of the Cincinnati Gas & Electric Company, a combination company; 100 per cent of the Dayton Power & Light Company, a combination company—and by "combination", I mean electric generating and distributing and gas distributing—and practically 100 per cent of the stock of, that is, over 95 per cent of the stock of the Union Light & Heat Company; and the electrical revenues, forgetting those companies' gas revenues but the electric revenues from those companies over a period of 3 years have in each year been approximately 95 per cent of the total carrying charges of Columbia Gas & Electric Corporation debt.

Otherwise stated, Columbia has in addition to any gas earnings, electric earnings available to it which fail by only 5 per cent to cover its total debt charges.

I have tried to point out in previous testimony that the risk on an electric company is materially less than the risk on a natural gas company, and the effect of those electric earnings improves the credit of the Columbia Gas & Electric Corporation which is also affected by the very low relation of debt to total property.

To make an exaggerated but perfect example, I testified on direct that the Ohio Fuel Gas Company, with assets in excess of $100,000,000 and earnings in the neighborhood of $4,000,000 had outstanding approximately $5,000,000 of notes. Let us assume that the Ohio Fuel Gas Company earned only 1 per cent on its $100,000,000 of assets. That would be $1,000,000. The $5,000,000 of 4 per cent notes would have interest of $200,000. So that earning only 1 per cent on its property and having a $5,000,000 debt, a company in that shape would have 20 times more property than debt, and would earn its interest charges 5 times. And I think that those obligations could be sold by a gas company.

In conclusion, the point of the rate of return is not to finance the underlying and best debt that a company has. You have to finance its entire capital structure including all of its common stock, which in the case of the Columbia Gas & Electric Corporation is approximately $500,000,000. But it is perfectly evident from the fact that Columbia's 6 per cent preferred stock is currently selling at a discount of 10 per cent, and that its common stock is selling for less than half of its book net worth, that on the returns which we arrived at in the cross examination, it would be impossible at the current market quotations to raise that amount of money.

1857 If we were refinancing the capital structure of the Columbia Gas & Electric Corporation at par the investing public would demand a very substantially higher earnings than our present rate of earnings to finance the equity securities. The $500,000,000 is the capital structure whereas the property value set up on our books and which was used in the calculation I made to arrive at the 3.52 per cent earnings was some $559,000,000. This figure as of November 30, 1939, has been increased to $578,500,000; but in figuring it with Mr. Slaff we took out certain intangibles just by estimate and that accounts for the difference between $559,000,000 and $578,000,000. I am afraid we are going to confuse this by a multitude of figures here. If we were refinancing the Columbia Gas & Electric Corporation the capital structure would be a most important factor. The amount of debt to the whole is conservative; it is low and therefore lower earnings will serve to carry that capital.

It is my thought that this $90,000,000 indebtedness to be represented by the new issue of bonds on which we are working in the Securities and Exchange Commission can be accomplished at less interest than the interest which is being paid on the outstanding indebtedness. We think we will be able to do this largely because we are going to change the form of the issue as I testified in answer to Mr. Slaff's question. The fact that this is a refunding operation is of importance in the matter of our ability to refinance at a saving of interest.

Questions By The Examiner.

We plan, Mr. Examiner, to sell a serial issue with maturities of from 1 to 10 years, and then 3 maturities, one 15, and one 20, and one 25—that is the present plan if we get to it—and of course, the interest rate on those very short maturities is extremely low; and that is what I mean by the form of the obligation making a great difference in its cost. The existing securities mature in three lots, some $54,000,000 in 1952, and $50,000,000 in 1961, and obviously a serial and 100 per cent sinking fund issue is a much better form of financing for a company that is heavily in the natural gas business.

In this refinancing issue there will be 10 serial maturities and then 3 maturities on a 100 per cent sinking fund basis. The rate of interest on our two existing maturities is 5 per cent. The rate of interest on the new serial issues in the refinancing will depend on the market when we are able to bring it out, but it will run from 1 per cent to 3½ per cent, 1 per cent on the first year, 1 and a fraction on the second, one and a bigger fraction on the third. You see, as we go away from the date of sale the risk increases to the investor and he demands a higher return. If we are able to sell in the existing market our interest savings should be approximately $1,500,000 per year. Our total interest today is about $5,400,000.

Redirect Examination By Mr. Morgan Resumed.

That would reduce it to about $3,900,000 a year. That interest would be on the $90,000,000 or on the amount necessary to take up the entire present debt. When
1858 I speak of a savings figure of $1,500,000 it is on $90,000,000 and not on $104,000,000. I think I would say there that of course the reduction in that debt makes a big difference in the sale of the securities. A reduction of $14,000,000 in your debt makes it easier to sell the balance. When we have accomplished that refinancing, if we do, Columbia Gas & Electric Corporation's part of the income of its electrical subsidiaries will be sufficient to take care of all of its fixed charges. It will be more than

Columbia Gas & Electric Corporation's total interest charges. I mean that Columbia's proportion of the net earnings of the electric companies which it owns, earnings available to it, will exceed the interest on the proposed new financing and that income, as well as the income from the gas properties, will be behind this bond issue.

We are talking about a consolidated picture. That is the income of the subsidiaries. In view of the fact that Columbia owns them wholly it could take that income, if it wanted to, and the sum of their income before being taken in dividends by Columbia will be substantially in excess of Columbia's interest charges, and I am sure that if they pay reasonable dividends that the dividends received by Columbia from electric operations would be more than its interest charges.

In the course of my cross examination Mr. Booth asked me some questions going to the point as to whether the natural gas industry is or is not a fully developed industry. I have given some further thought to that subject. The point that I had in mind was that in the past 10 years there has been an enormously rapid growth of the natural gas industry, and I named over or attempted to name over at that time, in response to a question by either Mr. Booth or Mr. Slaff, the number of states in which natural gas was served. Nor, those states, for example, Alabama, Arizona, Florida, Georgia, Iowa, Nebraska, Virginia and the District of Columbia have received natural gas or have been served with natural gas since 1928.

The following cities have been served with natural gas since 1928, that is, gas has been introduced in those cities for the first time or for the first time in many years. I believe one city did previously have natural gas. The cities served since 1928 are: Atlanta, Detroit, Ft. Wayne, Memphis, Minneapolis, Oakland (California), San Francisco, Chicago, Omaha, St. Louis, Syracuse, Washington. All of those cities are not served with straight natural gas—some are served with mixed gas as Washington is.

Due principally to this tremendous addition to the market, the number of gas customers which in 1928 was approximately 4,366,000, that is the number of natural gas customers, had increased by the end of 1937 to approximately 9,067,000. The source of the figures that I have just given is the United States Mineral Year Book for 1939 and Brown's Manual of Gas Companies. When I say

that all of these cities are not served with natural gas I mean that some of them, for example, the city of Washington, are served with mixed gas, natural and manufactured gas. Chicago has the same thing, of course. In qualifying that they received natural gas for the first time I am not perfectly certain that the city of Ft. Wayne, some
1859 20 years ago, did not receive for a short time, natural
gas. I am not positive but I am under the impression that it did; so that one city has at one time been on natural gas service.

The customers' figures I gave are the customers in the cities that began to use natural gas, roughly within the past decade, mixed or otherwise. The point is, where I differ from Mr. Booth, I think that any industry that has grown as rapidly as that in as short a period has, by the very rapidity of its growth, incurred risks. They are dealing in new markets. Ten years is not a long enough period to know what you are up against in marketing your product. In addition to which, the enormous increase in the use of natural gas, if anything, adds to the risk of depletion and exhaustion.

I think, Judge Morgan, if I may state so, we have a perfect example of exhaustion facing us now which is extremely serious. Could I use that as an example here?

In about 1931 the natural gas fields in southern New York and northern Pennsylvania were brought in. I think in March, 1931, the big well in the Tioga field came in, and as I remember, it came in at about 60,000,000 feet a day and around 3,000 pounds pressure. It blew the rig away, and they had to send to Texas for assistance to get it capped. That well was in the Oriskany sand. From that time until the present, there has been tremendous development of natural gas due to exploration in southern New York and northern Pennsylvania, largely in the Oriskany sand. Less than a year ago, the head of one of the big gas companies testified that in his opinion he had 13 years supply of gas. Last year in April I talked to the head of one of the big producing companies and his geologist and they told me that they had years' supply of gas for their market. In April again our head geologist testified before the Securities and Exchange Commission that he did not think that there was much more than a year's supply, and while his testimony, without being facetious was not characterized as airy, they felt very strongly that he overstated his case. That was April, nine months ago.

In February in 1937, Godfrey Cabot completed a line to Rochester, a distance of 90 miles, at a cost of approximately $1,700,000. A year ago he was delivering 30,000,000 feet a day through that line, principally to the Eastman Kodak Company. At present he is only able to deliver 3,000,000 feet and he has notified all customers that the service will cease in July of this year.

Over the last week end, in order to supply our properties in New York, it was necessary to take about 1,700,000 feet of gas from Pennsylvania through the western end of the system due to the small amount of gas supply, and a good many geologists think that the gas production in that area is very close to over. We have substantial reserves under contract, and as our geologist testified, can go on for a long time, but within the past week we have been considering looping our lines in order to supply gas from the west.

The point is that within a year some of the best informed men operating in that territory thought they had years of supply of gas, and there was at least one operator who felt so strongly enough three years ago to spend $1,700,000 and he has, unless he can discover new sources, lost just that much money. That is one of the risks in the gas business.

1860 I mentioned a while ago that we brought in 1,700,000 cubic feet per day from our western lines. If we had been relying solely on this southern New York-northern Pennsylvania field, the Tioga field, the domestic customers at the western end of the line would have suffered from shortage. As it was we had to let go all boiler load and dump load because we had no gas to serve that load.

Questions by the Examiner.

You ask why we did not use our reserves. In that territory, Mr. Examiner, we purchase our gas under contract and we own a minimum amount of acreage. The difficulty is that the geologists figured on a certain amount of gas and competitive drilling in that section has been extremely hard. Gas has been taken out from under the property of the owners and they consequently stand to lose their investment in transmission lines.

Redirect Examination by Mr. Morgan Resumed.

By my statement that we have reserves under contract sufficient for a number of years I mean our contracts in that territory are long term contracts. They have, of course, failure clauses in them if the contractor cannot supply the gas, but we have a large amount of acreage under contract, some of which has not been drilled but which I think we can reach to save the situation next summer if we have time to drill it, but it is new acreage and means exploration and all the risks involved there.

Not only a very, very large proportion of dry holes have been drilled in that area recently but those holes that are not dry went to salt water. I am not a geologist, but that sand, the Oriskany sand, has proved very difficult and there is evidently water there. That is only one of the difficulties that producers in that territory are finding and having.

I mentioned a while ago that Ft. Wayne probably had natural gas a good many years ago. That was before the depletion of the Indiana field. There were a great many cities and towns in Indiana that were served by local gas. That field, as you remember, was completely depleted and went out of business I should say around the first 15 years of this century. It was at one time a very large field and supplied those cities there in Indiana. I don't know if that field supplied through two 12-inch pipelines, or pipelines of about that dimension, natural gas to the city of Chicago for a number of years. I know that during the war we bought a lot of pipe from the southern part of Indiana which was no longer in use and we moved it to West Virginia. We bought it from other people; we did not dig up those lines, so I don't know.

This morning on redirect you asked me concerning the new issues of securities on which we have been working before the Securities and Exchange Commission and I stated what the earnings times interest on the present indebtedness is. I have made some calculations going to the earnings times interest that will result from that refinancing if it goes through as planned. Using the same estimated figure that I have used this morning for the interest charges on the proposed refunding issue

amounting to $3,900,000, in 1937 that interest would
1861 have been earned 2.7 times on the consolidated basis; in 1938, 2.36 times on a consolidated basis; and in the 12 months ended November, 1939, 2.7 times on a consolidated basis.

For the year 1937 it would have been earned 4.3 times on a corporate basis; in the year 1938, 3.65 times on a corporate basis. I have not available the corporate figures for the 12 months ended November 30, 1939. These calculations are made in haste and I would like to have the privilege of having them checked from an arithmetical standpoint. I am doubtful of my arithmetical summations.

If we were confronted with the refinancing of a natural gas transmission and production company you ask whether preferred stock would have any place in the new security set-up. Personally, I am of the opinion that preferred stock is not a proper type of security for a natural gas company that has a large proportion or a substantial proportion of production. Again expressing a personal opinion, I have even gone so far in the past as to say that bonds, except under very advantageous conditions for the industry, were not a proper form of security. That is exemplified by the fact that in the Columbia system we do not put either bonds or preferred stock against our producing gas properties. With bond issues when you have very heavy sinking funds and the bonds run a very short time, such as our serial issues, it may be possible, but I do not think it is good financing, and I certainly do not think preferred stocks for a natural gas producing company are good financing.

You ask what about a pipeline which is operated in connection with the production activities. Each company is a case in itself. As a generality, I would not like to put preferred stocks on a pipeline either.

I am familiar with what is known as an open end mortgage indenture. An open end mortgage provision permits the issuance of additional bonds upon bringing under the terms of the mortgage additional properties. Yes, I know of restrictions that we have found in this open end mortgage provision with reference to natural gas producing and transmission properties, but it goes further than that. In, I should say, carefully drawn natural gas bonds or bond issues, the indenture usually provides that additional producing properties shall not be bondable, that is, that you cannot buy additional producing properties, and usually the appurtenance of that property, gathering lines and so forth—and bond it for the new money.

In a good many mortgages, where the bankers or the drawers of the mortgage believe that there is a chance of that money going into the gas business, they will exclude producing properties, and in some instances transmission properties. Of course, with producing properties I include gathering lines. They either do it positively or negatively; in other words, they either describe the property that is bondable and omit that type of property from the description, or in some instances they have a specific clause saying that you cannot include gas producing property, gathering lines, and so forth.

1862 That character of restriction is placed in many of these mortgages because the drawers of the mortgage do not consider that natural gas producing property is properly bondable or falls within the security. It is too risky. And where they include in the restriction the transmission of property that reflects the same attitude. It reflects in reality the fear of complete depletion and the loss of value of the transmission property thereby.

Questions by the Examiner.

That applies to the case of the producing and transmission company as well as the so-called integrated company. In any company, Mr. Examiner, when you make a loan, that is, get out a bond issue on the property as it exists today, which is open ended, it is common to put a provision in that you can purchase new property and bond it to, say, 60 per cent or 66⅔ per cent. With natural gas companies it is lower, 50 per cent, but exclude from such bonded property producing properties. In other words, when a company goes and buys new acreage they must do it with their own money; they cannot borrow money for that purpose.

Recross Examination Interposed by Mr. Booth.

That means that they cannot borrow money under that issue for the purpose of buying the property included in the restrictive provision.

Recross Examination Interposed by Mr. Slaff.

It is true that sometimes they have already borrowed money under the bond issue on property which includes producing property. If you will look over the natural gas mortgages you will notice some,—I know some with which I have been connected in the past,—where the producing property is excluded entirely. There are two reasons for that. One is the lack of security and the other is the physical difficulty of including it.

The bonds of the Texoma Company are secured only by their producing properties, it is true; but they are held only by their own stockholders. It is not a public issue.

Questions by the Examiner.

My observation would apply to a mortgage bond issue of a producing company. Any careful drawer of a mortgage would, I think, put that provision in. There are those that have not had it and there are many natural gas bonds in default.

The point there, Mr. Examiner, trying to explain it,—supposing you have a company with property, including natural gas producing properties, of $1,000,000 and a provision in your indenture that you can bond future property at 50 per cent. Now, the company goes out and buys $500,000 worth of producing property and bonds it to 50 per cent. The issue is increased from $500,000 to $750,000, but the only added value is $500,000 of producing property, which may be quickly depleted, as for example the New York properties that I was discussing this morning.

1863 *Recross Examination Interposed by Mr. Booth.*

The fear of the lack of reliance of investors on values that have been placed on gas acreage may be a factor entering into these restrictions, Mr. Booth. The real factor is the unfortunate past history of these companies. A great many natural gas bond issues have been in trouble; and in the minds of investors that trouble arises chiefly from exhaustion of the fields. I think it is true that they do not have the utmost confidence in the value that is frequently placed by engineers and others upon gas acreage because nobody, no engineer, no body of men, can say exactly how much gas there is in a given place and everybody knows that.

Questions by the Examiner.

When I said the unfortunate past history of these companies I meant natural gas companies. I was not referring to defendants. I should have said that I meant the companies in the natural gas industry as a whole.

Redirect Examination by Mr. Morgan Resumed.

The restriction at page 9090 of the record contained in the Panhandle Eastern mortgage reads:

"The term 'fixed property additions' will not include among other things (1) the first $4,000,000 in cost to the company and/or one or more qualified subsidiaries, of fixed property additions purchased, constructed, or otherwise acquired by the company or a qualified subsidiary subsequent to March 1, 1937, or (2) any gas production property, viz gas acreage, gas wells, gas or gas oil leaseholds and other works and properties used in or useful for the production of natural gas."

The purpose of including that is to prevent the company in the future from buying with money borrowed under this indenture producing property, thus increasing the proportion of producing property to the whole, and in the opinion of the underwriters, I presume, and certainly in my opinion, reducing or hurting the security of the issue by including more producing property. (Objection by counsel for Illinois Commerce Commission overruled.)

Question by the Examiner.

You ask if we have such a provision in the mortgage indenture of the subsidiaries of Columbia Gas & Electric Corporation? We have no gas companies that are mortgaged. We do not mortgage our gas companies. I think there is one gas distributing company that has a small remaining issue but we did not put it on.

Redirect Examination by Mr. Morgan Resumed.

I have read Mr. Kleinman's statement on page 8038 of the record to the effect that a risk in business arises out of a decision which must be made by management and which, when made, will affect the subsequent profits realized by the business. I do not consider that a risk arises out of a decision of management. Risk is a possible future event which may be adverse to a business. It has nothing to do with a decision of the management. I think I have read all of Mr. Kleinman's testimony, and any answers, predicated on such testimony, which I may make are in light of my memory of his testimony.

1864 I have read Mr. Kleinman's further testimony as follows:

"In a discussion of risks in business, it is necessary, in my opinion, to distinguish between the continuous actions of conditions surrounding an industry and the continuous risking of money by the companies in the industry. The first set of factors in general determines whether the industry will be profitable as a whole. The second set of factors determines the relative prosperity of the companies within an industry. The risks arising out of the continuing commitment of money in a business are much more important than the risks arising out of the conditions surrounding an industry. The latter are slower and can be met over a period of years. The former are immediate and cannot be escaped. They can only be turned into a profit or loss. The risks surrounding an industry slowly affect the profitableness of the investment in the fixed assets, that is, the plant, the business itself; the other factors affect the profit and loss for a given period, and its cash and credit standing."

If I understand those observations by Mr. Kleinman I am not in accord with them. They are really difficult to understand. I will give an example by going to another industry. If you were in the airplane transportation business, what that testimony means to me is that the risk in your business is not that a plane will fall and kill some passengers and that you will be sued, but that you are investing your money for a long term. I could not agree with that. The risk in the airplane business is that a plane will fall and you will kill some passengers and be sued. That is the principal risk.

By the same token, go to the natural gas business. I think that among the immediate risks that we are running is, for instance, an explosion on the line, a failure of service, the exhaustion unexpectedly of the gas territory. Of course, time plays a part in that.

As I see it the type of risk which I have illustrated as applied to the natural gas industry is not a matter that is affected by the decisions of the management. From the standpoint of the investor he is most concerned with the risks that are of daily occurrence in the business and constant to the business, but I should qualify that answer, of course, by saying that the first thing that an investor would look at would be the management today to ascertain whether it is a good management. Bad management is the worst kind of a day-to-day risk. Having satisfied himself that the management is good the risk that an investor worries himself about is the risk that goes with the business, as in the gas business, exhaustion, explosion, landslides, failure of service.

At page 8041 Mr. Kleinman testified:

"Only public utilities and those few manufacturers whose raw materials and products are so specialized that there is no competitive market, escape this risk. The two companies we are considering have a very small percentage of capital in inventories, and the fluctuation in price is too small not to permit the recoupment of full cost through operations."

1865 I do not agree with Mr. Kleinman that defendants are without this risk of inventories. The time element and the rapidity of the turn are important, in the first place, from an inventory risk standpoint. That is exemplified by, for instance, a banker who purchases his inventory and turns it within hours, and he is satisfied with a very low mark-up, that is, the difference between the cost price and the selling price. As against that you take a furniture dealer. A furniture dealer, I think, ordinarily expects to turn his inventory about once a year, and if you have ever bought furniture, we all know that the general mark-up is about 100 per cent, in partial compensation to him for the long term risk of a year. A dealer in precious stones, a retail jeweler, is apt to carry his precious stone inventory a long time, and correspondingly marks up that inventory substantially; sometimes 150 or 200 per cent represents the difference between the cost price and the sales price. There are other departments in a jeweler's catalogue of goods that have the same type of large markup and long carry.

The natural gas company, this company or any other producing company, when it makes a contract with a purchaser, a city, it has to show that it has got an adequate supply of gas to fulfill that contract, and that is its inventory when it has a 5 or 10 or 15 year carry depending upon the contract.

Mr. Kleinman is right when he says that there may not be the rapid price fluctuation that there could be in diamonds or perhaps even in furniture, but on the other hand there is another risk, and that is that those inventories you can put somewhere and keep, whereas the gas inventory is in the ground and can get away from you. Somebody else can get it. Gas does not always stay; it migrates. So that while the inventory risk is different in industry and in the natural gas business, there is to my way of thinking a distinct inventory risk in the natural gas business.

You ask which is the greater risk in degree, to have 25 per cent of the total investment tied up in an inventory in the nature of an underground gas reserve in a field where there are hundreds if not thousands of others producing from the same formations and which must be provided with a view of supplying the requirements of a gas pipeline over a period of 15 or 20 years, or to have 25 per cent of the total assets tied up in an inventory of furniture or jewelry or automobiles manufactured and ready to be placed on the market.

It would seem to me, though it is hard to compare risks, but it would seem to me that the risk in the gas business would be greater, and not only because of the time element. There is one other very important element there. The furniture man or the man with the physical inventory can dispose of it and get rid of it at distress prices, but the gas man with his inventory underground could not even get it out of there fast enough if he should be distressed, admitting all the time that distress prices are not as apt to hit the gas man as they are the ordinary industry. But his inventory is locked in and he cannot get at it. He cannot save himself.

1866 If a man who had accumulated an inventory of manufactured commodities or goods, whether it be jewelry or dry goods or other type of merchandise, is subject to an era of high prices he can take advantage of the much higher price; but the man with the natural gas inventory is held down by regulation to the rate that is fixed. The rate is not regulated by contract as it was prior to regulation in the natural gas pipeline business.

At page 8041 Mr. Kleinman testified concerning another type of risk, as follows:

"* * * arises out of the labor situation. Whenever a manufacturer contracts to deliver his products at some future date at today's prices he must face the risk inherent in the labor situation. It must be kept in mind that in manufacturing industries the element of wages is a much more important part of sales value than it is in the utility industry and particularly in the case of the two companies." And "Further, their workmen are not collected in one locality, a condition which removes to a very great extent the risk of strikes and other labor disturbances. The principal substitute of gas, coal, is an example of the labor risk; natural gas has no substantial risk in this respect."

I am not wholly in accord with Mr. Kleinman's testimony. I think there are two very important things to consider there. It is true that generally speaking in the natural gas industry the men are trained to stay on the job, as is true in all public utility industries. The morale of the industry is to keep the service going and exists to a greater extent than in an industrial concern, I think.

I heartily disagree with the statement that because the men are isolated there is less labor risk. In our own experience we find where we have a compressor station with a hundred men in it, or 25 men, they are much easier to organize. The job is done much faster and you are under a much greater risk, because those 100 men can tie your whole system up. It is not like a big industrial plant where if a hundred men went out, the plant could still run. But I think defendants have perhaps 10 compressor stations. I don't know about all of them, but I can think of one, I believe, with 100 to 150 men in it that could stop the whole operation, and it is much easier to organize 150 men than it is 2,500 or 3,000. And I might say one further thing, that we have in our own experience found that sabotage in labor difficulties is far more dangerous in the natural gas business than it is in any industrial operation that I can think of at the moment. I suppose there are some.

Another risk which Mr. Kleinman discusses is the risk arising out of the overhead expense connected with the business, that is, the expense of operation other than productive wages and consumed materials. On this point he testified:

"To a certain extent these expenses go on even if a factory is shut down completely; to a greater extent these expenses accumulate, if the business is operating but at an unprofitable capacity. In the first place, the cubic foot sales of the Pipeline Company do not measure its revenues * * *

"Even if the Pipeline Company sold not one cubic foot of gas, it would collect a demand charge from its principal customer, The Chicago District Pipeline Company, sufficient to pay all of its expenses including its present interest. Any business that has its complete overhead paid for regardless of business conditions need not worry about risk. This one factor removes the Pipeline Companies from the plane of ordinary industry into that of a guaranteed industry." 1867

Without aggreeing or disagreeing with everything he says, there are certainly some things I do not agree with. I do agree with him in the general premise that the natural gas production and transmission business has a lesser risk of overhead. There is not as great a proportion of the continuing overhead; I agree with that.

I am familiar with that demand charge that the Chicago District Pipeline Company has obligated itself to pay for the privilege of calling on defendants for as much gas in any day as it has taken in any day. I do not consider that a guaranty. I think you move right there into probably the next subject of the credit risk; and while I believe that the credit risk of this company is different than the credit risk of an industrial concern, I think it still exists. In fact, I know it exists because it has suffered a credit loss.

I testified in the direct that, I think it was in 1934 or 1935, the Illinois Commission issued an order forbidding the ultimate consuming companies, that is the Peoples Gas Light & Coke Company, and so forth, from including in their operating charges more than a certain price for the gas that they purchased. Those companies then could not pay the Chicago District Pipeline Company for that gas in excess of that price, and the Chicago District Pipeline Company could not pay these companies the contract price, which is obviously to me a credit risk, and I think the figures are all in the record. My recollection is that this company suffered a loss of over 1¼ million dollars on that credit risk.

Now, there is the additional credit risk that these contracts are for a long term, and while the credit of the Peoples Gas Light and Coke Company and the other customers of the Chicago District Pipeline is excellent today, it is difficult to judge what it will be in 10 or 12 or 15 years hence, and I would prefer personally to have a more diversified risk. I mean a risk scattered among more people. I would rather have a million people owe me small bills than one person owing me as much as a million, no matter how good the one person.

Recross Examination Interposed by Mr. Booth.

I will be glad to accept your correction of the first part of my statement that in effect the Illinois Commerce Commission refused to approve the contract between Chicago District Pipeline Company and Peoples Gas Light and Coke Company which in turn was based upon payments by Chicago District Pipeline Company to the Natural Gas Pipeline Company. The net result is the same. The Chicago District Pipeline Company did not have the money to pay for the gas and that is what a credit risk is. This was testified to before and I am sure it is in the record and entirely corroborates my point. I did not want to exaggerate it. This arose through a Commission action and created a situation where the buyer was unable to pay.

1868 *Redirect Examination by Mr. Morgan (Resumed).*

I understand these companies wrote off a loss in excess of a million and a quarter dollars.

Mr. Kleinman also testified that "Another type of risk which the pipeline company does not face arises out of competition between rival concerns for the same market for the same product." Any natural gas company selling gas at wholesale or retail or any other way faces a very serious competitive risk from other fuels.

In industrial operations many industrial companies which are using gas for heating purposes even maintain oil connections and oil equipment, because many of these natural gas industrial contracts are on an interruptible basis. It is very easy for them when from a price standpoint it is advantageous to use oil, to switch right over, at a loss to the natural gas company.

From the standpoint of the use of gas in what we call the commercial contracts, small manufacturing, in recent years particularly, the use of gas for heat treating has been very largely replaced, or I would like to qualify that, has been replaced in many instances by electricity in small furnaces. An example is in your dentist's office. Your dentist 10 years ago used gas for heat treating. Today he uses electricity. That is not for his instruments for which he puts in a little gas flame, it is for his furnace in his laboratory.

Another example that you see all over now is in vulcanizing tires in the service stations. There is a little electric disc that you just put on the top, and it vulcanizes the patch on. Formerly that was sometimes done with a blow torch, or if gas was readily available, with gas.

The same is true of a great many of those small uses, which is competition and is a risk of the gas business.

Finally, there has been a great deal of talk in the industry about the loss of cooking load to electricity, and I have already testified as to the decline in the Columbia system of the domestic use of gas, and I think other witnesses in this case have testified to the same thing in connection with the Chicago companies. A good deal of that arises through the use apparently of electricity for cooking purely on a style basis, where there is no competition in cost, but the woman who has a gas stove sees her neighbor and friend, Mrs. Jones, with an electric stove, and she wants one to keep up with Mrs. Jones. So style losses are not confined to the millinery and the ladies ready-to-wear departments of business in general.

The next risk that Mr. Kleinman discusses, beginning on page 8045, is the risk arising out of the varying demands for a product, in which he says:

"This type of risk must not be confused with the demand for a particular manufacturer's product which I just discussed. In general, the risk of varying demand for a general product cannot be overcome by any manufacturer. For example, when the demand for steel falls off, a
1869 manufacturer may obtain increased sales at the expense of his competitors but he nevertheless has been facing the risk inherent in change in demand. The experience of the Natural Gas Company has shown the pressure of this type of risk, but it takes a microscopic examination to find its effect in the profit and loss account. Its sales to industry during 1938 fell off substantially from the

peak in 1937 but the effect on profits was hardly noticeable and could be determined only with a very detailed study."

I think I have already testified that we estimate for the Columbia system that the drop in domestic use between 1929 and 1938 per customer has cost us about $5,000,000 in net for the system as a whole. I don't want to be facetious but I don't need anything to see that. That was a drop from about 78,000 cubic feet per customer per annum to 58,000 cubic feet per customer per annum in the residential load.

In the industrial load, I think I testified on the direct, and there is testimony in this case to show, that fluctuations in the industrial load follow very closely the curve of industrial activity for the country as a whole, and all you have to consider is the wide fluctuation in the steel business. Steel mills shut down, and with a big steel mill, some of which use as much gas as a city, shut down that load is gone. You don't get any revenue from it.

Exhibit 136 shows that as between the years 1937 and 1938 the gross revenues declined from $15,552,607.50 in 1937 to $14,441,349.76 in 1938, or a difference of something more than $1,100,000 as between those two years; and the net earnings from operations as between those years declined from $10,763.067.30 in 1937 to $9,884,745.28 in 1938, or a difference of nearly $900,000.00. I would not regard a decline of substantially $900,000.00 out of a total of $10,763,000 in net earnings from operations as between one year and the following year as one requiring a microscopic examination to find its effect on the profit and loss.

We would consider that very important and it is particularly important because this is an industry with a very large amount of capital invested in relation to its earnings; therefore, when you get that much drop in earnings it is more important than it is in an industry where the amount of capital is not as great in proportion to the gross earnings or to the net earnings.

It appears that the gross sales in 1937 were 74,476,893 MCF and that in the following year they had declined to 68,759,039 MCF, which is about 9 per cent, and that is about the same percent reduction as the reduction in the net revenues from operations.

Those three sets of figures, the decline in the net from operations, the decline in the gross, and the decline in the sales on the volume basis, indicate that that fall in revenue was attributable directly to varying demand.

The varying demand for natural gas as between the years and as between portions of the same year is regarded by the natural gas industry and by those investing their money in that industry as a real and substantial risk. One of the great difficulties of the natural gas business is to maintain 1870 the supply during the winter months when you have tremendous demands on your system, and to be able to live during the summer months when your demands shrink very low. A month-to-month curve of the volume of business of the Columbia system shows the steepest hills and valleys in demand, and that is a risk in the business. There is a constant effort of the gas companies to increase the summer load and level out the winter load to a reasonable extent. So you have two types of shifts there,—inter-season shifts, and inter-year or inter-period shifts, and it does not take any explanation to know what the difference in the temperature do to a company. We, in our system, figure that 1 degree temperature changes the average domestic customer's use approximately 6 feet. Now, if you multiply that by a million that is 6,000 MCF which at 50 cents is $3,000; in other words, a degree's change in temperature for the system can change your daily earnings $3,000. I think my arithmetic is right on that.

Recross Examination Interposed by Mr. Booth.

Of course, it could increase it as well as decrease it.

Redirect Examination by Mr. Morgan (Resumed).

You have a limitation by the capacity of your lines and you have a certain temperature limitation. It only gets so cold. Many winters are warm but very few of them are colder than normal. It is perfectly proper to say that with weather as cold as this last week we were having great difficulty in supplying our demand with the extensive system we have. Two weeks before we did not know what to do with the gas. That is a risk of the business.

By my observation that the winters get warmer but not colder than normal I meant that there is a limit as to how cold a winter could be on the down side; but if you have a winter with average temperatures of 65 degrees at this latitude, which sometimes occur, you sell very little gas for house heating or for other heating purposes; and the average temperature is sometimes higher, but it is unheard of to have a winter that would average 5 or 10 degrees below zero for three or four months. We had just such a winter as I first spoke of in 1932. That was a very warm year.

Recross Examination Interposed by Mr. Booth.

I have the exact figures for the year 1936. (Examining papers.) The month of February, 1936, Mr. Booth, in the territory served by the Columbia System, was 10 degrees below normal winter temperatures—the coldest month that we have recorded back to 1927. The next coldest month was 7 degrees below normal, and there are only two of those. But there are many instances of months that were 6 and 7 and 8 and 9, 10, 11 and 12 degrees above normal.

Redirect Examination by Mr. Morgan (Resumed).

As a matter of fact appliances which utilize natural gas in the home or establishments requiring furnace fuel are limited in their intake capacity. If they turn them on full blast on an exceptionally cold day and that is not
1871 enough there is nothing to do but go to bed. They cannot increase the gas intake. That helps too to this extent. They will burn their ovens and leave them open and turn everything on that they have for heating; but even that won't make up for the comparatively long periods of warm weather, apparently. This varying demand becomes a very important factor with the industrial load as I think was brought out both on my direct and redirect examination.

Still another risk concerning which Mr. Kleinman testified as appears on page 8047 is the risk due to technological changes; about which he said:

"Risk due to technological changes which face the two companies. The type of risk which arises out of technological changes has several aspects. In most lines of industry there is a need for expending substantial sums of money in research on the products to be sold. In our case the product, natural gas, needs no such research expense and its sales cannot be affected by the research expense of any competitor which results in an improvement in the quality of its gas."

I do not think Mr. Kleinman's testimony covers the technological risk or hazard that confronts the natural gas business. I would agree with Mr. Kleinman that the natural gas business certainly does not spend as much money on research as, let us say, general business; there is no question about that. I am not saying at this moment whether that is a wise and far-sighted policy or not. The technological risk of the natural gas business is the risk already spoken of this afternoon, of the development of other heat processing, particularly. I spoke of the vulcanizing of tires and the dentist's furnace. It is true in all small shops where they use small heat treatments. Electricity has replaced gas with the technical improvement of the electric furnace. Just after I spoke of that a moment ago it occurred to me that there is a domestic coal stove being sold now called the Agfa stove, a self-contained stove with practically complete combustion. The initial cost of that stove is very high. The operating cost is extremely low, and the makers say there is no radiation from it. Everything is cooked within the stove. You can put your hands on it while it operates. I can see how that stove might give great competition to gas cooking.

The same thing is true of the newer electric stoves which have little radiation so that the person cooking on the stove does not suffer from the heat as much as over the older type of stoves. The gas industry has made some advance there, but not as much as the electric industry, or certainly as much as this new Agfa stove.

The point is that it is not the technological improvements in the gas industry alone that affects the overall demand for gas. Technological improvements on the outside affect that demand also, although I agree with Mr. Kleinman that the cost of technological improvements in the gas industry has not been as great as in other industries in general. The risk of losing customers or losing volume to the customers
that we have is not confined to the technological sit-
1872 uation in the gas industry alone, but it is affected by
technological improvements in the appliances of the
electric, coal burning and oil burning industries, and in all
heat treating industries.

I do not agree with Mr. Kleinman that the effect of change in utilization appliances of competing fuels would be small in amount and slow. That is what I am talking about.

1873 At page 9592 Mr. Kleinman testified in substance that the witnesses who testified for defendants on the subject of rate of return did not mention as elements or factors entering into the judgments that they reached on rate of return any risks as to inventories or overhead or labor disturbances. He then added in substance that in his opinion the weakness of their testimony was that when you are appraising risk you cannot pick out those three risks or six risks or ten risks as present in the natural gas industry without discussing them relative to other industries to be used as the standard for arriving at a conclusion of rate of return, and without taking into consideration all of the risks of all kinds of business.

In arriving at the conclusion to which I testified on direct examination, I did not use as my standard the risks and earnings of unregulated industries. I used it for purposes of orientation and to demonstrate to my own satisfaction the competitive demand for capital and the conditions under which capital was found. Had I followed that course that you suggest or that Mr. Kleinman suggests, I think I would have made direct comparisons with industrial or other companies. Now, I did not do that, and of course we had for example before us an excellent comparison, because if I embraced that theory, I would say that as completely a comparable risk as you could get to a natural gas pipeline would be, let us say, a gasoline pipeline. There is a gasoline pipeline that serves in the same general territory that these companies serve. It extends from the Panhandle of Texas or southwestern Kansas to Minneapolis, with a branch off to Chicago. That is the Great Lakes Pipeline Company. The rate of return on that company was testified to by Mr. Dow, Fayette B. Dow, before the Monopoly Committee just prior to the time that I appeared for the direct testimony here. I did not consider that it gave as fair a comparison or as broad a picture to make a direct comparison there.

(The following testimony was stricken by the Examiner on motion of Commission Counsel over objection of Counsel for the Company: "In that particular instance the Company transports gasoline and transports it as a carrier for a tariff, that is, it is not using a contract to market at the end of a line but its rate of return is calculated in my exhibit for the year 1938 as approximately 33%. For 1937 it was approximately 30%. Those figures are taken from the Temporary National Economic Committee's bulletin beginning September 26, 1939, and on that subject on page 539 there is a graph that shows the rate of return on the major gasoline pipelines, on the independent crude pipelines, on all companies reporting to the I. C. C., and on the major crude pipelines. The gasoline pipelines essentially started in business in 1929 and in that year and until the end of 1930 they lost money. Since then the rate on all of these companies has increased until at the end of 1938 it was 30% according to this graph. I intentionally did not make a direct comparison like that or other direct comparisons of risk to other companies even though this particular company is, of course, regulated.''

I did say that if an investor had as many dollars as there were companies listed on the Chicago Stock Exchange, as shown in my exhibit, and invested a dollar in each industry, or the same number of dollars all in defendants' undertaking, that there would be less risk in the first investment because of the diversity factor.

Columbia Gas and Electric Corporation owns subsidiaries having both electric and gas properties. It is a holding company but owns the securities of other companies which own distribution properties, as well as companies owning pipelines and production properties. In my direct testimony I made the point, as I remember it, in substance that these particular pipeline companies involved in this inquiry face an additional risk and are at an additional disadvantage through the circumstance that they do not own any distribution companies and do not control the sales policies in the distribution of their natural gas. Columbia has had to do with selling at wholesale and distributing its own gas. It has been the experience of our company that there is an advantage from the standpoint of building up the load in owning the distribution company which controls the distribution policy. There is such an advantage particularly where you are selling the gas to a former manufactured gas company. The policies involved in the sale of manufactured gas and natural gas are different, and it is difficult for the selling personnel of the manufactured gas company to embrace, understand, and solve the problems involved in the sale of natural gas.

1874 Practically speaking, the manufacturing company makes gas and pumps it to the holders, and from the holders it is pumped out to the customers. There is always a limit to the amount of gas that can be handled, and the average manufactured gas man is afraid of peaks, high peaks. For natural gas, on the other hand, the holder is an enormous pipeline. There is a great capacity there, and in many natural gas companies, most of our own, we are accustomed to operating at low load factors, and consequently we have not the same fear of peaks. I mentioned in the direct, the house heating business. The house heating business is a peak load business, and it has been our experience that it is hard to get the personnel, the sales personnel in the manufactured gas companies, to push house heating business with the enthusiasm and the results that the sales personnel in the natural gas business does. In fact, in some instances we offer particular covenants in the contracts to encourage the sale of house heating.

Approximately 8 per cent of the domestic customers of the Columbia system have house heating installations. Those figures apply throughout the system as an average. It varies widely in different places. For example, in Charleston, West Virginia, house heating saturation is practically 100 per cent. It will move downward in other places where there is very little house heating.

The last figure I saw for the Chicago distributing company was about 12,000 house heating customers out of 850,000. That was approximately 1½ per cent. I have some notes here. In Detroit, natural gas was introduced there in 1935, the estimated house heating saturation is 6 per cent. That is approximately 27,000 house heating customers out of 440,000. In the Columbia system, we estimate that our saturation is about 8 per cent, but last year of all the new homes built on the system, that were centrally house heated, approximately 33⅓ per cent were heated with gas. That is an estimate from the sales department. In Chicago, the last figures I saw were 12,700 house heating installations, a saturation of about 1.52 per cent.

I believe there is a difference in our system in the percentage of saturation, as I have used the term here, in those cities where we control the distribution sales policies and those in which we sell at wholesale. It is very difficult to get the figures. I could not prove it. We are convinced that that is the case. The best example we have is where we have purchased properties. As soon as we have put our own force to sell house heating on those properties, there is a big increase in that load.

At page 9605 Mr. Kleinman, referring to defendants, made the statement in substance that as compared to ordinary business, they have a very substantial lack of risk and that capital generally recognizes that investment in utilities is a safer investment than it is in business generally. He then added: "I mean all utilities, even those that have gone bad. Electric utilities are the highest. Telephone, water companies, are better than some telephones, and so forth, but that whole field is superior." I do not agree with that conclusion. That is not the attitude of the investing public.

The first thing my mind jumps to is the street railways. There was an enormous loss to investors in them. I
1875 cannot help thinking of the natural gas business as a whole and the losses that have resulted from that in the distant past. We spoke of the Indiana field this morning. This is a matter of history—the losses there. The losses resulting from financing in 1928 and 1929 through failure of the fields, through failure to obtain markets, and the investors who I see, and I see a great many professional investors and bankers, consider the naural gas business a very risky business, as I do.

I remember one company, a producing gas company, that in 1928 was financed for $3,600,000 first mortgage bonds, and I think $800,000 debentures behind them. That property was located in Kentucky. The gas was drawn out from under it, and the same property that they financed for over $4,000,000, sold at auction within the year for $156,000. The investors just cannot forget that kind of loss.

The experience that Mr. Cabot had over here in the Tioga field is a perfect example. Three years ago he was willing to spend $1,700,000 for a transmission line; and he has now had to advise the customers on that line not to expect any gas through it after July this year. Cabot has been doing pretty well in the gas business. He is, I am afraid, losing a good deal of money in the New York field just now.

The Cabot organization used to be in West Virginia. I think Mr. Cabot has gotten out of the carbon black business. I cannot speak for his other interests outside of the Appalachian field. He is the same Cabot who was connected with the Cabot Carbon Company, which operated down in the Panhandle, but I am not familiar with that operation.

1876 CHARLES W. KNAPP, JR., a witness for the Federal Power Commission, recalled for further cross-examination, testified:

(January 8, 1940.)

Cross-Examination by Mr. Morgan Resumed.

I have Exhibits 197 and 198. In connection with my direct testimony the Commission offered Exhibit 185. It was developed in cross-examination that I had not shown the comparable yields on transactions in common stock securities but had confined my figures largely to bond yields. That is partly true. Subsequently I prepared Exhibits 197 and 198 to meet that point. Exhibit 185 does contain data on yields from purchases of preferred stock of electric operating utility companies for the period from 1935 through 1939. It was only with reference to common stocks that you inquired as to why we have not supplied similar information.

In preparing the additional exhibits I did prepare some figures having to do with the yields on electric operating utility preferred stocks. You ask why I picked out electric operating utility preferred stocks rather than the stocks of other classes of utilities for the purpose of developing these figures. First of all I did so because it followed a consistent pattern with our studies that we have presented in great detail in connection with electric utility bond issues. My explanation of why I believed the electric utility yields and earnings were justified in this study is the same as that advanced by me when you asked why I selected electric utility bonds in getting up Exhibit 185.

Exhibit 197 contains 21 issues of preferred stocks. The number at the left is an identification number which is or will be found in the footnote in a study made by the Federal Communications Commission entitled "The Problem of the Rate of Return in Public Utility Regulation," and in the tables and schedules included therein, the items were designated by number; and it was thought it would facilitate the tracing through of these items if those numbers were retained. In their study they included additional companies. I don't know the exact number, as a matter of fact. I do not think it was more than two times this number. It may have been slightly more, but, as indicated also in the footnotes here, I selected only those issues for which dividend and prior requirements were earned in excess of 1½ times in 1938.

You ask if these are not the highest rated stocks that are included in that study by the source. These preferred stocks were not described as such; but as I gather the intent of your question, they would be those of the highest quality in the study. These preferred stocks are recognized as among the highest quality of preferred stocks that are being bought and sold by the public, and they were selected for that reason.

Of the 21 companies listed in Exhibit 197, some of them are electric and gas. I have not made any particular study to determine how many of them are in the natural gas business. It may well be that some of these companies handle distribution of natural gas, either in its original state or mixed with manufactured gas, but I would not be prepared to state which ones or how many of them. I did not think it was necessary to make a detailed study of each one of these companies for the purposes 1877 of this exhibit. I think that the companies here listed are shown as electric operating utilities. I do not think it would require any extensive study to verify that point. It was necessary to determine for my purposes, of course, whether they should be classified as electric operating utilities, and I did so determine before making this schedule, but I do not retain a recollection of all of the details involved, which are contained in the sources to which I referred.

I made no detailed study to determine the source of the electric current that each of those companies distributes as to whether it is manufactured or generated by the distributing company or purchased from other sources. I could perhaps go through here and indicate companies which largely generate their own power and others which purchase; but I did not make any detailed study and do not have a summary of any such details with me. You ask if I do not undertake to keep myself informed concerning details of that kind as far as concerns the electric companies whose statistics pass over my desk. I don't know as I can answer that categorically. As I said a moment ago, I made no specific study relating to these companies for the purpose of determining the exact quantity of power produced, but I would not care to make any generalization based on that. You ask if I tried to find out those who were generating their own electricity or were using steam power or utilizing hydroelectric facilities. I have a knowledge of some of these companies, and the names of some of them indicate the nature of the source of power.

The principal reason for selecting these companies was that they were electric operating utilities. I don't believe I was asked if I selected the companies whose securities were of the highest quality. I was asked if these companies were of that character, and I thing I answered in the affirmative.

Questions by the Examiner.

The fact that dividends and prior requirements were earned in excess of 1½ times in 1938 would indicate that these preferred stocks were of a high quality; but I did not mean to imply that I had selected these companies in any other way than by reference to times that preferred dividends and prior requirements were earned. The 1.5 times requirements earned is getting pretty close to a lower limit. In other words, if preferred dividends and prior requirements are earned less than one time, the preferred dividends would not be earned.

You ask why I selected 1.5. I felt that that was a reasonable starting point. Unity is what an investor would ordinarily demand for investment purposes. He might take something that was not earning its dividends for speculative reasons, but unit is the lowest point at which the investor would be willing to consider, I imagine, a preferred stock as an investment, and as you approach—as you rise above unity and approach two and three times earning power, the quality of the preferred stock increases.

Cross-Examination by Mr. Morgan Resumed.

You state that you understood me to say several minutes ago that I had picked these because they were of the highest quality of preferred stock. I picked these because the preferred dividends and prior requirements were earned in excess of 1½ times, and that in itself indicated that they were above the level so far as quality was
1878 concerned. The quality was better than those whose earnings were covered less than 1½ times. I don't re-

member that I said that I selected them because they were of the highest quality, but, as I explained, these would be of the highest quality. I just don't understand what the distinction in terms is that is involved. I am just trying to make a frank statement; I just don't want to do anything other than that.

You ask why I have a fewer number of companies in Exhibit 198 than I do in Exhibit 197. The reason for that is simply explained by the holding company dominant in the electric utility industry, and if a holding company owns in excess of 95 per cent of the common stock, as is true in the great majority of instances, it does not leave you a very large selection from which to determine any price rates, because you do not have the market price which you need in computing that ratio. In Exhibit 198 I listed all of the stocks listed in Schedule 26 of the Federal Communications Commission study from which I took them, provided that at least 5 per cent of the issue was in the hands of the public. I excluded the gas companies from that exhibit for the same reason that I did from Exhibits 185 and 197. I confined the common stocks to electric utilities for the same reasons I have stated in connection with my testimony concerning Exhibits 185 and 197.

The Pacific Gas & Electric Company possibly has some natural gas distribution. I don't know of any other that would have. You ask if I noticed anything out of the ordinary about the earnings price ratio of that particular company. It has a very high earnings price ratio. The earnings price ratio for the Pacific Gas & Electric, based on the market prices for the week ended November 17, 1939, is 8.53 per cent. That is based on earnings per share for the twelve months ended June 30, 1939. There is another issue, Southern California Edison Company, Limited, for which the earnings price ratio on a similar basis, except that earnings are for twelve months ended September 30, is 9.11.

You ask if I have any way of accounting for that high earnings price ratio in the case of Southern California Edison Company, Limited. I believe so. I believe that it is generally—if these earnings price ratios are related statistically to percentage of gross income available for the common stock as shown on the same exhibit, it will be found that as the percentage of gross income available for common stock increases, the earnings price ratio tends to decrease, and you will note in the case of the Pacific Gas & Electric Company that for the year ended June 30, the percentage of gross income available for the common stock was 40.95. In the case of the Southern California Edison Company, the corresponding percentage was 39.72. And those two issues reflect the highest earnings price ratios on this exhibit, and at the same time reflect the lowest percentage of gross income available for the common stock. I would not care to make a statement as to whether there is municipal competition or a threat of it in the city where Southern California Edison Company, Limited, owns its distribution facilities. I may have read something about it, but I would not be willing to offer my recollection as any testimony on it.

You ask if these companies listed in Exhibit 198 are not also companies whose securities are of the very highest quality in the electric field. I would not care to make a commitment on that question. That had nothing to do in this case with the selection. I included in this exhibit all issues which I could find in this study that 1879 was referred to by the Federal Communications Commission, which were issues of electric operating utilities and common stock issues of which at least 5 per cent of the issue was held by the public. I made no attempt to classify them as to quality except insofar as the column to the extreme right calling for the percentage of gross income available for common stock is an indication of quality.

Questions by the Examiner.

This is an exclusive list of companies. There are not very many electric operating utility common stocks on the market. I have listed those here which were held by the public to the extent of 5 per cent of the outstanding issues. Your question as to whether by and large that list represents the cream of the electric operating utility crop, so to speak, I do not think can be fairly answered because I have shown nothing here with respect to companies which may be equally as good or better than these companies but which are wholly owned by holding companies.

Cross-Examination by Mr. Morgan Resumed.

You ask if I can mention one that will qualify as being better than this group of companies here, even though its stock is owned by a holding company. It is difficult to make any generalization about such things as better or equal to or the same as, in these cases. There are always points of comparison. Or there may be a combination of them, but there are companies whose bonds carry high ratings which are among those companies which are wholly-owned by holding companies. I can give you the names of a few of those. Among public utilities whose bonds carry Aaa rating are the Brooklyn Edison, which is a subsidiary of the Consolidated Edison Company of New York. Yes, the Consolidated Edison Company of New York is in the list. The Duquesne Light Company, which I believe is a subsidiary of the Philadelphia Company, is also among those whose bonds carry Aaa ratings. In the same classification would be New York Edison, which I believe is a subsidiary of the Consolidated Edison of New York, and the Philadelphia Company, the affiliate of which I do not recall. I am referring to my Exhibit 185, Schedule 1, page 8. Moody's Manual does not rate common stocks. I could get Moody's ratings on their bonds, of course.

You ask if I am saying by my last answer that some of these companies whose names I read from Exhibit 185 are in my judgment, better companies than those listed in Exhibit 198. I said a moment ago that I did not think it was possible to generalize about what is better, equal to, or worse than. I could have included in Exhibit 198 from the same source a number of gas distributing utilities. I believe there were gas operating utilities included therein. I excluded them because I desired to confine my studies to electric operating utilities.

In Exhibit 185, Schedule 23, I had some figures concerning average weekly earnings indexes, and in Schedule 22 I had factory employment and payroll indexes. You ask if I made any further study of that subject to see whether or not information concerning wage scales is available. I have not made any such study as that. There has since come to my attention some data which is published in the State of Illinois on employment and payrolls, but I am sorry that I have not had the opportunity to examine that thoroughly.

1880 Yes, I have access to a publication known as the Survey of Current Business, issued by the United States Department of Commerce. It gives information on employment and payrolls, yes, sir. I am familiar with the publication in general. I have not prepared any figures from that publication showing the prevailing wage scales, particularly in the field of construction, over that period 1929 to 1939, inclusive, the same period covered by my Schedule 23, Exhibit 185. If they are in the source concerning which you have just asked me, I will be glad to know it, but I have not noticed them.

You have handed me the 1938 supplement of the publication "Survey of Current Business, United States Department of Commerce, Bureau of Foreign and Domestic Commerce, Washington." You asked me to take that and state into the record from that source the figures for common and skilled labor under the caption "Construction Wages" beginning with the year 1929 through the succeeding years. These are the monthly averages of wages per hour. They are not the monthly wages but the monthly averages of hourly wages. The caption says "Dollars per Hour." The information appears to be divided into two categories, common labor and skilled labor. For the year 1929 the figures for common labor in dollars per hour are .547; 1930, .561; 1931, .50; 1932, .427; 1933, .456; 1934, .532; 1935, .528; 1936, .564; 1937, .645. Skilled labor—for the year 1929, $1.36; 1930, $1.38; 1931, $1.27; 1932, $1.02; 1933, $1.01; 1934, $1.10; 1935, $1.09; 1936, $1.15; 1937, $1.32.

I have read those figures but, without having an opportunity to examine into the basis of their preparation or to make any study at all, I would not care to ascribe any significance to them. You ask if I am willing to accept the figures coming from that source as authentic figures. I don't know, not having studied those figures, just what industries are involved, what kind of construction labor, and so forth. The weekly wage scales here on Schedule 23 of Exhibit 185 are for the United States, the wages of weekly earnings in ninety manufacturing industries. Those for the State of Illinois, according to my recollection, are a cross-section of Illinois industry representing somewhere in the neighborhood of 60 per cent for factory wage earners and factory payrolls.

You have asked me to turn to page 177 and see if that discloses the source of that information and the character of the construction that is included in the figures. I will read what appears there, if I may.

"Compiled by the Engineering News Record, and represents the hourly wages of both common and skilled labor in the construction industry as of the first of each month. Both the skilled and the common rates are the arithmetical average of wages actually paid in 20 cities, as follows,—New York, Boston, Philadelphia, Baltimore, Atlanta, Birmingham, Cleveland, Cincinnati, Detroit, Chicago, St. Louis, Kansas City, Dallas, Minneapolis, Denver, Seattle, San Francisco, Los Angeles, Pittsburgh, and New Orleans. These data are compiled from monthly reports that correspondents in 20 cities submit as to wage rates. Union wages actually paid are used except where non-union jobs predominate. In some instances, it has been necessary to average the rates for union and non-union where both exist.

"The skilled rates are the average of the three principal trades, carpenters, bricklayers, and structural iron workers in heavy construction."

It goes on to say where comparable data prior to these dates can be found.

1881 Now, you have asked me after reading that, to consider its importance, and I would say that I see no mention made with particular reference to the natural gas pipeline business, that it says "heavy construction, iron workers," but it combines bricklayers, carpenters, and iron workers. Whether I would have used that had I had it is another question. Pipeline companies in their various construction activities may have employed all of these classes of construction workers, but I am not familiar with pipeline construction. I am not an engineer.

You have handed me the February, 1939, supplement of the same work, and on page 69 of that publication I find the monthly figures continuing the figures which I just read into the record on down to October, 1939. These figures are as follows: For common labor during the year 1938, for the month of January, .680; February .675; March .675; April .677; May .673; June .677; July .677; August .677; September .677; October .682; November .682; December .682.

For skilled labor during the same period, January $1.39; February $1.39; March $1.40; April $1.40; May $1.40; June $1.42; and for the remainder of the year $1.43.

For 1939 for common labor: January .682; February and March .680; April .683; May .682; June and July .684; August, September, and October .685.

For skilled labor in 1939: January and February $1.43; and for the remainder of the period to and including October, $1.44.

The monthly average shown by the publication from which I have read is .500 for common labor for the year 1931. The monthly average for the year 1939 is about .685, an approximate 37 per cent increase since 1931. For skilled labor the monthly average for 1931 was $1.27 and for 1939 is approximately 17 cents higher, an increase of approximately 13 per cent.

1882 E. V. KESINGER, a witness for defendants, called for redirect examination, testified:

(January 9, 1940.)

Redirect Examination by Mr. Morgan.

As I stated heretofore, I am general superintendent of the two pipelines involved in this proceeding. I have occupied that position since January 1, 1932, when operations were commenced. Prior to that time I was chief engineer in charge of the engineering work connected with the construction of the pipeline properties from the beginning of construction to completion.

In the cross-examination of Mr. Delafield on October 28, 1939, he was asked concerning unusual developments in the gas industry in the last five years. At page 6712 of the record he stated in substance that there had been constructed within the last few years two high pressure lines, which he briefly described there in his testimony. In his redirect testimony here yesterday he corrected his former testimony at that point by stating that he was mistaken in thinking there were two high pressure lines, adding that there was only one.

I have made an investigation as to the capacity and operating pressures and stresses of the line to which he referred to in that testimony. The smaller diameter line to which he referred is operated by the Hope Natural Gas Company. It states at their Cromwell station near Charleston, West Virginia, and runs northeast for 95 miles. The south 65 miles of that line is made up of 12¾ inch outside diameter pipe, commonly known as O. D. pipe, of which the wall thickness is ⅜ of an inch. The north 30 miles of the line is made up of the same kind of pipe, with the exception that the wall thickness is 5/16 of an inch. There is only one of those high pressure lines. In speaking of the smaller of the two lines I was referring to his original testimony. He said he thought there was one line 18 inches in diameter and a smaller line also. Yesterday he said he was mistaken about the larger line.

The line concerning which I have obtained the information is the same line that was referred to in a magazine article which counsel for the Commission read into the record at pages 6192 and 6193 by T. R. Weymouth. That line was designed to operate at a pressure of 1300 pounds on the south end of the line at the Cromwell station, and a pressure of 1000 pounds at the point where the 5/16 inch wall pipe starts, 65 miles north. The 1300 pounds on the 12¾ inch O. D. seamless pipe with a wall of ⅜ inch would result in a fibre stress of 22,000 pounds per square inch. The 1,000 pounds on the 5/16 inch wall pipe would result in a fibre stress of 20,400 pounds per square inch.

When the line was completed it was tested to a pressure of 1287 pounds. This produced a fibre stress in the ⅜ wall pipe of 21,880 pounds. The line has been operated at pressures ranging from 700 to 850 pounds. The 850 pounds produces a fibre stress of 14,450 pounds on the ⅜ wall pipe.

Comparing these pressures and stresses with the operating pressures and stresses at which the lines of
1883 defendants are operated, we limit the maximum operating pressure on the 24-inch pipeline of defendants to 720 pounds. It must be remembered that the 24-inch pipe on the system of these two companies is of two different wall thicknesses. The seamless pipe is 5/16 inch wall, and the electric welded pipe is 11/32 inch wall. Consequently, the 720 pounds maximum operating pressure produces a fibre stress of 27,650 pounds in the 5/16 inch wall pipe, and 25,130 pounds per square inch in the 11/32 inch wall pipe. The 27,650 pounds on the seamless pipe compares with the operating stress of 14,450 pounds on the 12¾ inch line about which I first testified a few moments ago.

Another comparison that might be made is that if and when the Hope Natural 12¾ inch line is operated at a pressure of 1300 pounds, for which it was designed, the fibre stresses will compare as 22,000 pounds on the Hope system to 27,500 pounds on defendants' system. You ask me to explain how a line operating at a pressure of 1300 pounds would have a lower fibre stress than a line operating at 720 pounds. The pressure alone is not a measure of fibre stress resulting from that pressure. It is also necessary to know the diameter of the pipe and the wall thickness. The Hope Natural Gas line is 12¾ O. D., and the wall thickness is ⅜ of an inch. The pipe on defendants' system is 24 inches O. D. and 5/16 inch wall. The fibre stress varies directly with the pressure, other factors remaining constant. The fibre stress also varies directly with the diameter, the other factors being constant; and it varies inversely as the wall thickness increases or decreases, other factors remaining constant.

There is a formula by which we can take any given piece of pipe where we know its diameter and its wall thickness and determine the fibre stress on that piece of pipe at any assumed pressure. The commonly accepted formula for this calculation is known as Barlow's formula. It is expressed in this manner: Fibre stress in pounds per square inch is equal to the product of the pressure in pounds per square inch, multiplied by the diameter in inches, divided by two times the wall thickness in inches. That formula produces the figures showing the stresses to which I have testified. The constant is two times the wall thickness. The figure 2 is the constant. Expressed in symbols, the formula is F is equal to PD over 2-T, the F being fibre stress in pounds, per square inch, the P being the pressure in pounds per square inch, the D being the diameter in inches, and T being the wall thickness in inches.

The term "high pressure" has been used in this record to refer to the practice employed on the system of the Texoma and Natural Gas Pipeline Company of operating their pipeline system at pressures in the neighborhood of 700 pounds as compared to the prevailing practice in the natural gas industry prior to 1930 of operating gas pipeline systems at pressures in the neighborhood of 320 pounds.

The term "high stress" has been used to refer to the employment of fibre stresses in the neighborhood of 25,000 pounds on the system of Texoma and the Natural Gas

Pipeline Company as compared to the prevailing practice in the natural gas industry prior to 1930 of operating pipeline systems at fibre stresses ranging from 11,000 to 15,000 pounds per square inch.

The term "high pressure" may not be necessarily significant, when used by itself, since it is also necessary to know the diameter and the wall thickness of the pipe if it
is desired to know the fibre stress. The term "high
1884 fibre stress" is more significant particularly when
you are referring to the degree to which the steel is
being utilized in its normal operation.

Mr. Floyd C. Brown testified concerning an extensive research study to determine whether or not it was feasible to build a gas pipeline from the Panhandle of Texas to the Chicago area. He testified that their original investigations of this subject convinced them that the project was not feasible and that he recommended against proceeding at the close of the first series of studies. The use of the high pressure at which these lines are now operated is not the only factor which makes the operation of defendants' pipeline feasible. There were a number of factors involved, the high pressure being one of them. It should be remembered that from 1926 forward, when the engineers were working on this project trying to determine how to design it, and how to make it feasible, that they were confronted with the use of lapweld pipe. The maximum fibre stress that could be used in design work where this pipe was to be employed was 15,000 pounds per square inch. Also the steel in this pipe has a yielding point of 25,000 pounds per square inch, and an ultimate strength of 45,000 pounds per square inch.

The development of a higher grade of pipe of more uniform wall thickness and more uniform physical properties by two manufacturers brought about a change in some of the basic factors. The pipe that became available was manufactured from a steel that had a yield point of 35,000 pounds per square inch, and had an ultimate strength of 60,000 pounds per square inch. The uniformity of the physical dimensions and the physical properties were such as to lead us to conclude that it would be safe to utilize this steel at fibre stresses in excess of those that had been employed, consequently the design employed in this system utilized fibre stresses in the neighborhood of 25,000 pounds per square inch. This term is indicative of the degree of utilization of the factors employed in the pipe.

The higher pressure and the higher pipe stress were very important points or important factors, but those were not the only factors involved that resulted in the building of this project. The other factors, I believe however, have been fully and clearly covered in the record.

1885 W. C. GILMAN, a witness for defendants, called for redirect examination, testified:

(January 9, 1940)

Redirect Examination by Mr. Morgan.

I am the same W. C. Gilman who has testified in this case before. I am the same Gilman whose testimony is discussed in the brief of counsel for the Commission under the title "Heads We Win, Tails You Lose." In the opening paragraph of counsel's brief reference is made to the circumstance that I was formerly an employee of the government in the capacity of chief or director of the Public Utilities Division of the Securities and Exchange Commission. You ask how I happened to obtain that position. I was asked to come to Washington to help in the establishment of the Public Utilities Division of the S. E. C. soon after the passage of the Public Utility Holding Company Act of 1935. At the time I was asked to come down here I was employed by the Equitable Life Assurance Society. I had a job. I did not agree when I came down here that I would spend the rest of my life in that job.

The. S. E. C. has rules concerning the limitations that former employees of that department are under when they leave the employment of the government. I have observed those rules in every way.

Questions by the Examiner.

The rule is generally to the effect that any former employee of the S. E. C. who leaves the employment of the Commission shall not engage in any practice before the Commission for a client with respect to any matter which was pending before the S. E. C. while he was with that body.

Redirect Examination by Mr. Morgan Resumed.

In the course of my cross-examination I was asked concerning my testimony in a case before the New York Public Service Commission involving some proceeding between that Commission and the Brooklyn Union Gas Company. In the brief filed by counsel for the Commission there is a quotation from my testimony in the Brooklyn Union Gas case appearing at page 7243 and subsequent pages of the record, given by me in response to questions by Mr. Hertzoff, who is referred to in the brief as assistant to the Corporation Counsel of the City of New York. The questions and answers quoted are:

"Q. Would you say that an investment in a natural gas company is a better class than an artificial gas company like the Brooklyn Union or a manufactured gas company?

"A. I hate to generalize.

"Q. Oh, you have generalized all along.

"A. I would say that—yes, that in the past few years, experience in what has gone on has demonstrated that investors are more willing to buy the securities of natural gas companies than they are of the artificial gas companies."

1886 You ask what securities I was talking about in my answer to those questions. At page 7245 of this record, after that testimony was read by Mr. Slaff, I stated that "there have been in recent years many million dollars worth of natural gas pipeline bonds sold, particularly to institutional investors. While I was at the Equitable, we bought many million dollars of such bonds of short maturity with heavy sinking funds. At that same time, we were not buying the bonds of artificial gas companies. Natural gas pipeline bonds were special types of securities and fitted a special position in the fortfolio of the investing institution. And that is what I meant by investors being willing to buy the bonds of natural gas companies."

I thought that my explanation at that time in the record right after that testimony had completely explained my position in the matter. In the redirect, no consideration whatever was given to any further explanation of it.

I do not see how anybody, and I did not think that anybody could misunderstand my position, but Mr. Slaff's brief certainly does.

Questions by the Trial Examiner.

You ask in what respect I think the brief misinterprets my position. The brief implies that in the Brooklyn Union case I took the position that manufactured gas bonds or manufactured gas securities were riskier than natural gas securities and in this case the reverse. I do not think that in any reading of the testimony and my explanation any one could properly take that position.

Redirect Examination by Mr. Morgan Resumed.

I did not testify in the Brooklyn Union case at any time or in any place that the risks in the artificial gas business were greater than the risks in the natural gas business. In this record I testified that there was a greater volume of transactions in the bonds of the natural gas industry than those of the artificial gas companies. I have not at any time testified to the contrary of that. I have said in a number of places in this record that in recent years there have been many more bonds of natural gas companies sold than of artificial gas companies. They are bonds of peculiar character or special character, short maturities and heavy sinking funds, and from that point of view have been relatively attractive to institutional buyers who want to put their money to work and who want to get it back and see it coming back over a short period of years, at which time they hope to be able to reinvest it at higher interest rates than the present level.

My position is that by reason of the character of the natural gas bonds which have been offered and the character of the artificial gas bonds which have been available, the investing public has seen fit to put more of its money into the natural gas bonds of the character that were issued than they have in the type of artificial gas bonds which were available to them. This is true for the principal reason that the natural gas companies during the past five years or so have offered a particularly attractive type of security to investors at this particular time, relatively short maturities and heavy sinking funds. At the time I was discussing the risks of the natural gas business as compared with the risks of the artificial gas business in
1887 my direct testimony in this case, I made that distinction that there is a difference in the short term view-

point and the long term viewpoint in the risks of the two types of companies.

Also in the same brief of counsel for the Commission appears a quotation not from this record but from the brief of someone described by counsel as "the fair and temperate Mr. Mulligan." That brief was filed in the Brooklyn Transit case, which has been mentioned here. That was a tax case in the State of New York, involving taxes for the year 1916 of the Brooklyn Rapid Transit Company and other companies in that street railway and elevated railway system. In the computation of those taxes, called franchise taxes, the formula which had been established over a period of years required the establishment of rate of return. My testimony delivered in 1938 was with respect to a proper rate of return for the Brooklyn Rapid Transit Company and system companies in the year 1916. The testimony was delivered before a Special Master of the Supreme Court of the State of New York.

In connection with the study and investigation that I made, which was a rather difficult problem because the testimony was delivered in 1938 and was supposed to go to rate of return proper in 1916, was a study of historical cost of capital to the B. R. T. I considered it of some importance in forming my judgment as to what was a proper rate of return, and I followed the method suggested and outlined by the staff of the Federal Communications Commission in their study of rate of return, to which reference has been made a number of times in this case.

A substantial section of that study of the staff of the Federal Communications Commission is given over to a development of a method of computing the historical cost of capital. I followed that method exactly. Naturally, there were different figures to be inserted in the formula, and to the best of my ability and to the best of my judgment, I obtained the proper figures on the B. R. T. system and inserted them in that formula, which the staff of the F. C. C. had developed, and put that computation of the historical cost of capital in exhibit form, and it was inserted in the record in the case.

I had never read Mr. Mulligan's brief until it was called to my attention from Mr. Slaff's brief. However, as soon as I saw that he had prepared a brief and made some comment about my method, I obtained it and studied his criticism. I think that his remarks with respect to my methods followed are financially illiterate, and that is the best way

I can characterize Mr. Mulligan's comments with respect to the methods that I followed. I stand back of those methods, and I defy him to meet them.

Questions by the Trial Examiner.

The Brooklyn Rapid Transit case was mentioned in the cross-examination very briefly. I think I stated when I was being asked as to my qualifications that I had testified in the matter of the rate of return in connection with that case. I was not cross-examined on that case. There was no extract of anything from the record in the Brooklyn Rapid Transit case, if my memory as to what I was asked on cross-examination is correct.

1888 *Redirect Examination by Mr. Morgan Resumed.*

At the top of page 132 of the brief by counsel for the Commission appear the first few words of an answer of mine as follows: "I think it best to be honest." I have examined the page of the record at which those words appear. I made no reference to this statement in my redirect examination. I did not think it necessary to mention it. You ask just what I meant by those words and how the matter came up. Well, I think originally that I should have said, "I think it is best to be fair," but I was very disturbed on the witness stand, and I said, "I think it is best to be honest." I really meant that those words should be directed to Mr. Slaff, because I thought that he was implying and getting into the record the implication that I had no responsibility with reference to the investment of large sums of money, whereas I very definitely recollected that I testified to having spent a substantial number of years with the Equitable Life Assurance Society, and having made recommendations to the Finance Committee, through the Treasurer of the Society, with reference to the purchase of some hundreds of millions of dollars of securities. I thought it was clear in my direct testimony where I said, I am sure, a number of times, that I made investigations of utility companies and prepared recommendations for the Committee, and that the Committee acted on those recommendations.

I never tried, in my opinion, to imply that I was the head of the Equitable Life Assurance Society, and that I alone had the responsibility with reference to several hundreds of millions of dollars. Obviously that would be silly. This question that he was directing to me at page 7371 was: "You did not have any final responsibility for the investment of those large sums of money or any sums of money outside of your own personal moneys?" The use of the word "final" there I thought was unfair, an unfair word to put in there to characterize the work that I had done, and that was the reason why I said, "I think it is best to be honest." I am sorry now—at least I think I should have said, "I think it is best to be fair," and I was directing those words to Mr. Slaff.

I did not imply at any place in this record that I had the final responsibility for investing those moneys by the Equitable. I think it is very proper to have on the record the fact that I did not have any final responsibility. I did not want to leave that impression, but the point is that I at that time had the feeling that Mr. Slaff, consciously or unconsciously, was trying to leave the impression that I had misrepresented my position with reference to what I did at the Equitable, and therefore I directed those words to him, "I think it is best to be honest." As I have just said, I think I would more clearly have conveyed what I was trying to convey if I had said to him: "I think it is best to be fair in your questions, Mr. Slaff."

I think this cross-examination to which I have just been referring was sometime after my cross-examination about my position with the Central Hudson Company. As I remember it, the reference to my position with the latter company was very early in my cross-examination.

I was present and heard the testimony of the witness, Mr. Fred Kleinman, who testified for complainant in this case. I have read his testimony since I heard him testify. On page 8038 of the record Mr. Kleinman was asked certain questions to which he answered in substance that:
1889 "A risk in business arises out of a decision which must be made by a management and which, when made, will affect the subsequent profits realized by the business." He added that it is necessary to distinguish between continuous actions of conditions surrounding an industry and the continuous risking of money by the companies in the industry. Continuing, he said that the risks arising out of the continuing commitment of money in a business are much more important than the risks arising out of the conditions surrounding an industry.

I am not in accord with the conclusion that the so-called internal risks, as Mr. Kleinman classified them, are much more important. I think the risks surrounding any industry are of great importance from an investor's point of view. The risks due to changes in the habits of people, changes in the arts, outside developments, are completely beyond the power of any management to control and are of extreme importance, and are so considered by investors.

You ask into which of the two classifications would fall the risks involved in the uncertainty of the life of the source of supply. I don't know whether we can actually put that in one slot. Certainly one phase of the question of supply can be placed on the external side, and that is what other people will do who are taking gas from that field down there. That question is completely beyond the power of the management of defendants. No decision of theirs can affect it except as it is affected by their own operations. If there are great developments or great increases in the demands for carbon black, and if the carbon black manufacturers take a lot more gas for carbon black, or if chemical industries use natural gas, or if there are increased takes by other lines, and things of that kind, those are factors which will affect the operations of this company and affect its supply. Those things are beyond the power of the management to control.

Then there is the risk of salt water intrusion. That is certainly a risk that the management has no control of. I suppose salt water intrusion might result or be increased depending upon the takes of gas by other takers, but the presence of salt water in the field and what is going to happen as the result of it is not a matter that can be controlled by the management, except in the manner in which they drill and operate their own wells.

I did not use the earnings and the risks of industrial companies as a basis for my judgment as to a proper rate of return for this company. I think it is clear in my direct testimony that I made a comparison of risks between pipeline companies and electric companies and artificial gas
companies, and the basis of forming my judgment was
1890 by comparing the risks of electric and artificial gas
distribution companies, and so forth with the risks of
the pipeline industry.

I did introduce in an exhibit a PWA project study under the Securities and Exchange Commission which showed net earnings before income taxes of a substantial number of American industries. At the time I introduced it, there was substantial discussion and argument about the use of it, and I stated at that time that that study was among other studies in my exhibit, and was useful for orientation purposes and to indicate what capital invested in industrial establishments had been earning over a period of time, but I did not from those figures arrive at the rate of return to which I testified.

In other words, my approach was to try as best I could to relate the risks and the necessary rate of return for defendants to the regulated concerns which I sought to distinguish or compare in the course of my testimony. I approached it from that side and not from the unregulated side. When you speak of regulated concerns, I relied primarily on concerns in the electric and gas field.

I testified that one of the risks confronting these pipelines and the business in general is the risk of exhaustion of supply. Mr. Kleinman testified on a phase of that subject at page 9440 of the record and said in substance that he thought any investor faced with a decision of the Federal Power Commission, founded on a complete study of the facts, company evidence and Commission evidence, would be more inclined to look upon the possibility that that field would last beyond the life found by the Commission than he would to look at the risk that the field would not last as long as the Federal Power Commission said it would. I do not believe that the attitude of an investor would be as Mr. Kleinman says it would be. I do not believe that an investor, having before him the decision of the Federal Power Commission with reference to the life of the supply, is going to say to himself, "No, it will last longer." I just do not believe that.

If we assume that the Federal Power Commission has heard the evidence on both sides and has done its best in the exercise of its judgment to determine how long that field is going to last in the light of the facts that can be developed as of this time, and it determines that it will last 16 years from the first of this month; and if we assume that these companies desired to refinance their capital investment or the value of their property partly by bond issue, in my judgment it would not be possible for defendants to sell at the prevailing bond rates, such as have been offered in evidence here in the course of these proceedings, an issue of bonds that would extend to the end of that full 16-year period. Investors buying the bonds would require a margin of protection. They would not be willing to take the risk of buying bonds which matured at the completion of the life of the supply. That would not imply that there was anything wrong with the finding of the Commission; but it simply means that the prospective bondholders would want a margin of protection. There is no surety. Even though this life of the supply is determined after a careful investigation and after a consideration of all the evidence in the world that it is possible to get, there is still the risk that the supply won't last as long as that life is determined to be.)

Anything that is in the ground and cannot be seen is very
difficult to measure exactly. The history of our coun-
1891 try is full of the stories of the mistakes which people
have made where the basis of their judgment was
estimates with reference to mining enterprises. If we could assume for a moment that they could ascertain exactly what is there, still they could not determine how long it would last or how long it would be economically available. That is true because there is the factor which is still unknown and that is how fast it is going to be taken out of the field by this company and by the other companies who are presently taking gas from the field or who in the future may take gas from the field.

You ask if in addition to the uncertainty that it cannot be determined how much gas will be taken out by all of those taking it out, there is also the uncertainty that formation developments might put a large portion of the wells out of business, or economic conditions might cause the stopping of production at a time short of the time they would stop if conditions continued as they are now. The investment banker and ultimate investor would take all those things into consideration, every single possibility that might result in an unfavorable condition with respect to the company whose securities he would or would not purchase. The bondholder in order to get the margin of protection that he wants, would first of all require that the amount of bonds be modest or relatively modest in proportion to his evaluation of the assets; and secondly, he would demand that the maturity of the bonds be in advance of the shortest competent estimate as to the life of the supply, and probably a 25 per cent margin below that. If the estimated life be 16 years, based on what investors have required in the past, the investor would probably fix the maturity of the bonds at 12 years. Under those circumstances the risk that the field would not last on through the remaining four years after the maturity of the bonds would fall on the equity security holders. As a matter of fact, the bondholder would place as a condition upon the advance of the money on the bonds at the prevailing rates that that risk, as far as he could protect himself against it through that safety factor, would shift to the equity holders. The bondholder gets a small hire for his money, and he is not going to take the risks of the other security holders in the enterprise, who are entitled to and would demand a higher return on the money that they have put in for the riskiest part of the enterprise.

A person buying the equity security knows that he is taking the risk. If he buys the common stock of a company that has contracted to pay off a substantial part of the debt over a period of 10 or 12 years, he is the residual security holder, and his ultimate profit is dependent on the final results, the over-all results of the enterprise. In the meantime, the bondholder has assumedly received his interest and has been paid off.

Recross Examination Interposed by Mr. Slaff.

Yes, the equity holder gets all the benefit if the field lasts beyond the estimated life, and he gets all the grief if it lasts below.

Redirect Examination by Mr. Morgan Resumed.

What Mr. Kleinman has characterized as an attractive speculation does not remove the risk.

Recross Examination Interposed by Mr. Slaff.

You ask if what I have testified to today was not all substantially covered in my direct testimony and if I have added any new element. I have no new point of view, Mr. Slaff. I do not think in my direct testimony I testified in quite the A, B, C, language which I think I have used just now. I don't think there is anything new in what I
1892 have said. I think it is just a different manner of explanation. I am not changing any position I took in connection with my testimony on direct or cross-examination.

Redirect Examination by Mr. Morgan Resumed.

At page 9460 Mr. Kleinman was asked if he knew anything about the Tioga field in New York. He replied that he knew gas wells were brought in a few years ago, about 1935, and for a while there was some rather rampant speculation in the field. I have some knowledge of that field. I have recently made some study of the gas situation in the Tioga field. I have read the testimony in the case of the New York State Natural Gas Corporation, a company which operates out of that field and which is engaged in a proceeding with the New York Public Service Commission and the Federal Power Commission at the present time with respect to rates. I have been in the field and examined some of the wells. I have been there while drilling operations were going on, studied the report of geologists of the State of Pennsylvania and the State of New York, and have talked with the head officials of a number of companies who operate out of that field.

The gas supply in that field is failing rapidly, according to the testimony of the geologists. An officer of the New York State Natural Gas Corporation testified less than a year ago that they had a supply available to them through their own production and purchase at that time of around 55 billion feet. Some 9 month later or less, he testified that they would have to revise their estimates due to a large number of dry holes and salt water and that his best present estimate was 13 billion feet.

Questions by the Examiner.

In both cases the witness to whom I have just referred was testifying in a rate case before the Federal Power Commission. It is a well known fact that the gas supply, at least as presently known, in that field has depleted very rapidly, and it has reached a point where pipelines running out of the field have cut off their interruptible customers to the extent that they can be cut off immediately, and have given notice to other industrial customers where notice was required. News and knowledge of that kind travels very rapidly. It is known in the investment world.

Recross Examination Interposed by Mr. Slaff.

I cannot have any basis of measurement in determining how that has affected the securities of a particular company like the Northern Natural Gas Company. These securities, as you know, are held by institutions, and it is impossible to get any market appraisal. I think refunding securities of that company this past summer were sold to six very large institutions at very favorable prices. To try to give you as good an answer as I can, I don't know that the failure of the Tioga field would have any direct effect at this time on the price of the securities of companies such as the Northern Natural, but I do take the point of view that failures of this kind, failures of supply in the natural gas industry are bound eventually to have an influence in the minds of people who are putting their money at stake.

1893 Yes, I testified that as the years have gone by recently natural gas securities have become more attractive to investors. That is right as to natural gas bonds. I cannot say the same thing, and won't say the same thing, with reference to common stocks, because I do not think that is the case. Certainly natural gas bonds, with the terms which the natural gas companies have been willing to put in them, short maturities and heavy sinking funds, have been attractive to the institutional investor.

Recross Examination Interposed by Mr. Booth.

No, I would not say that an investment in the equity securities of the defendants would be an unattractive investment. I think that a study of the historical financial picture of the common stock of defendants reveals that it is a sound investment. From 1936 on they have received very substantial dividends.

Redirect Examination by Mr. Morgan Resumed.

In my opinion that does not relieve the risks that confront these particular investments at this time.

At page 9605 of the record it appears that in answer to questions on cross-examination Mr. Kleinman made an observation that these companies have a sheltered position. When asked what he meant by "sheltered position," he answered: "I mean as compared to ordinary business that they have a very substantial lack of risk. That capital generally recognizes that investment in utilities is a safer investment than it is in business in general." He was then asked whether he meant natural gas companies or all utilities. He replied, "I mean all utilities, even those that have gone bad." That is not the attitude of the investing public as I know it and understand it. I just do not understand what Mr. Kleinman had in mind when he said that investment in industry was more risky or less desirable than in utilities which have gone bad. I do not see how anything could be worse than an investment in some of the utility companies that have gone sour, investment in the street railway business, investments in the telegraph business, investments in the steam railroad business. Millions and millions of dollars have been lost in those industries. Those are examples of utilities which have certainly in many cases gone bad.

I know of no unregulated industrial businesses or classes of business who are seeking or petitioning the legislatures or the Congress to put them under regulation. You might imply that some of this coal price regulation might be moving along that line. I do not think that any industry is asking for complete regulation. I do not think that Mr. Kleinman's statement that there is sentiment among the investing public that regulation removes the risk is a correct statement. I don't think that regulation removes risk at all.

Recross Examination Interposed by Mr. Booth.

I can't point out in the record just where Mr. Kleinman used those words. I do not know definitely that he has made that statement in those words. I said that regulation does not remove all of the risk. I do not mean to imply that it does not remove some risks. Certainly an electric company serving a community and operating under a franchise which it obtains perhaps by virtue of regulation does have freedom from competition of other electric companies in the same territory. If a natural gas
pipeline company, which has built its line into a cer-
1894 tain territory, now finds that under the law no other
natural gas company can, except under certain re-
stricted circumstances, build a line into the same territory

without the consent of the regulatory body, it would find itself relieved of certain substantial risks. If no other line could come in, it would be in the position of having no competition from natural gas in that market. If no natural gas line can come in without getting a certificate of authority from a regulatory agency, that would help to improve the competitive situation and relieve to a certain extent the existing natural gas company of certain risks.

Redirect Examination by Mr. Morgan (Resumed).

You ask whether that situation would be met by the Natural Gas Act if the application for a certificate of convenience and necessity comes from one who, by reason of the discovery of a gas field closer at hand, can sell gas at a lower price than defendants can sell it. I have read the statute on that point. I don't know how anybody can be sure of his ground until the statute has been in operation for a number of years and there have been interpretations of it; but certainly the implication is in there that it is the purpose of this act to bring natural gas into communities at the cheapest possible price. From that there is the implication that if somebody discovers gas near a city which is presently being served by gas, that it is the purpose of that act to allow that natural gas to go in there at a cheaper rate. I am familiar with the language of Section 7, subdivision (c) of the Natural Gas Act, which you have just read to me, contains the language: "In passing on applications for certificates of convenience and necessity, the Commission shall give due consideration to the applicant's ability to render and maintain adequate service at rates lower than those prevailing in the territory to be served," it being the intention of Congress that natural gas shall be sold in interstate commerce for resale for ultimate public consumption, for domestic, commercial, industrial or other use, at the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest. As an investment counsellor I do not regard that as conferring any monopoly on defendants of the market they serve. I regard it as just the reverse.

I have just said that we do not know how that is going to be interpreted yet because the Act has not been in operation long, but certainly the implication in there is that monopoly will not be maintained, and that whenever gas can be brought into a community at a cheaper rate, it will be so done.

You ask, if a gas field should be discovered in the State of Illinois, if the Federal Power Commission would have any jurisdiction over it so far as bringing gas from that field to Chicago was concerned. There have been a lot of arguments about the jurisdiction of commissions under the use of the words "interstate commerce," but I should judge that if gas were discovered within the State of Illinois, and the lines hauling gas from that field were wholly within that State, such a company would not fall within the jurisdiction of the Federal Power Commission under the Natural Gas Act. I am assuming no connections with any interstate companies.

Recross Examination Interposed by Mr. Booth.

I am not wholly familiar with the Illinois statutes which prohibit the construction of such lines by any public utility without a certificate of convenience and necessity. The general requirement of those certificates of convenience and necessity is that before transmission facilities may be built, you go to the Commission, and after a hearing
1895 and a proper showing as to the public interest being served, you obtain your certificate of convenience and necessity. It may be denied.

Questions by the Examiner.

You ask if these risks of regulation were all considered in my testimony on rate of return. I do not think they are of any substantial importance from my point of view. I stated in my direct that regulation under a new law on which there is no history entails in the minds of the investors some uncertainty. That influenced to a very minor extent my figure on rate of return. I took it into consideration, Mr. Examiner. I do not even know whether it influenced me, but I took into consideration that this company was operating under a new law and under regulation on which we have not any history, and we don't know how it is going to be interpreted, and things like that.

Recross Examination by Mr. Booth.

I have not made any determination of how much it would cost to build a competing line from the southern part of Illinois to the Chicago area. I did not in my testimony or in calculating my rate of return assume that that was any particular risk of this company. It is probably one of the things that ran through my mind, but I did not consider it as of sufficient importance to have given any special allowance for it. That is my statement today and my statement before.

I know how much it costs, generally speaking, to build natural gas lines. To build a 20-inch line or something like that would cost around $25,000 a mile for the line. It would cost $125 a horsepower, or something like that, for compressor stations if any were necessary. That would be a very rough estimate of the cost of the line.

This morning I had said in response to your questions, Mr. Booth, that I was familiar to some extent with unit costs of building gas transmission lines. To build a 20- or 24-inch line would cost in the neighborhood of $20,000 or $25,000 a mile, depending upon the factors such as right of way, steel prices, and such things; and to build compressor stations would cost from $100 to $150 per horsepower. A 400-mile line of that size would cost perhaps somewhere in the neighborhood of $10,000,000 for the bare line. You would have to have a lot of other factors to be able to make an estimate of the compressor station capacity. You would have to know the pressure at which the line was to be operated, you would have to know how much gas was to be carried through the line, and such things.

Of course, the first thing I would have to do would be to acquire a supply of natural gas. There is nothing in my testimony this morning from which it may be reasonably inferred that I had come to the conclusion that there was an adequate supply of gas in the southern part of Illinois in large enough quantities to attract the investors to build a line from there to the City of Chicago. You ask if there is any natural gas down there at all in commercial quantities. It all depends on how you define "commercial quantities." I have read some reports about oil in southern Illinois and some reports about gas, small amounts of gas, in southern Illinois and southern Indiana, but I have made no specific investigation as to the amounts of such gas.

1896 I don't think that anybody would put up the money for a project of that kind unless they were reasonably sure that they were going to get that money back and get a return on the money. They would want a return of at least 8 per cent, I think. I haven't a feeling that there is any immediate prospect of anybody putting up any money to build a line from any natural gas reserves which I am able to state as adequate reserves to serve a market like the City of Chicago, even though they could get that market.

1897 **JOHN A. COOKE, a witness for defendants, called for redirect examination, testified:**

(January 9, 1940.)

(At this point the Trial Examiner announces that upon motion of Commission Counsel he orders stricken all of Mr. Delafield's answer which starts on page 10140 to through most of page 10141.)

Redirect Examination by Mr. Morgan.

I have testified before in this case that I am identified as a partner in the firm of Peat, Marwick, Mitchell and Company, a partnership. The general business or profession of that firm is professional accounting practice. I live in Evanston, but my office is in Chicago.

The principal offices of defendants are located in Chicago. I have sustained professional relations with these two pipeline companies during the past several years. We first took up professional work for them toward the end of 1933 and have continued annually since then. At the end of 1933 we made arrangements to examine the accounts from the inception of the companies up to the end of 1933. They had no previous outside auditors up to that time. We have served as an independent accounting firm. We have not worked under their direction in the performance of our duties but have simply used their records as the basis of making an examination and a report to them.

You ask me over what period my first engagement took me in their accounts. Our first work covered the accounts from the inception of the company up to the end of 1933. It extended even prior to that into the construction accounts. We made a review of the capital charges there or the accumulation of the construction costs right up to the time of the inception of the Natural Gas Pipeline Company of America, at which time all of the work done by the construction company was turned over to the Pipeline Company and to the Texoma Company.

An arbitrary date was selected to mark the termination of the construction period and the beginning of the operation period. That arbitrary date was December 31, 1931. The reason for an arbitrary date being taken was that as the construction neared completion, the company was able to pass gas through its lines in small quantities, and get some revenue, and so you had running contemporaneously there, the construction and revenue earning. For convenience, December 31, being the end of the company's fiscal year, was taken as the date as of which you should cease to consider any expenses, that is operating expenses, as a part of construction cost, and after which those expenses should be applied against revenue produced from gas sold.

Our audit disclosed that as of December 31, 1931, construction work was still going on. It was not all finished then.

You ask what we do in the performance of our duties as an outside or independent auditor when we go and audit the books of defendants. It is quite a large program, but it may be summarized as a verification of the assets and liabilities as of a certain date, and the review of the operations and transactions regarding operations in the period covered by the examination.

Our first work began after the first of Januarw, 1934,
and covered the period ending December 31, 1933.
1898 We found that up to the date last mentioned nothing
had been set up on the books with regard to depreciation, depletion, and retirement ~~of capital~~ invested in acreage. We so reported in our report on the accounts. We began in the latter part of 1933 working on the construction accounts, but the work then was left in abeyance until the 1933 accounts were closed, and we went in in 1934 and completed the work. Our first audit covered the

period ending December 31, 1933, instead of the end of 1932.

In our report to defendants early in 1934 and in our discussions with the management prior to our report we raised the questions concerning the state of the accounts as to depreciation, depletion, and retirement of capital invested in acreage. We would in any concern where it had not been taken care of; and in our report we mentioned that it had not been done. We were advised that it would be given consideration in 1934, and in that year it was ultimately. We sat in in a consulting capacity at that time, but the accounts for 1933 were closed without anything being set up in there for depreciation or depletion.

I have here a signed copy of our report of defendants in 1934 for the year 1933 and prior years. On page 10 of that report, which is dated March 23, 1934, on the Texoma Company we say:

"The original acquisition of leaseholds on acreage in gas producing territories, from the participating companies, was made on a basis of an over-all price of approximately $45.00 per acre without discrimination as to desirable or undesirable territory. It is the contention of the company that the total purchase price in all probability would have approximated the same figures had the acquisition of leaseholds been confined to such sections of the territories as were really desirable, consequently on relinquishing and reassigning leaseholds on acreage, as and when such was determined to be undesirable, in order to terminate the expense incident to the carrying of such acreage, no adjustment was made on the accounts with respect thereto. We have been informed that it is the intention of the company to fix a date as of which all such discriminatory reassignments shall be considered to have been accomplished and that thereafter all necessary abandonments or reassignments shall be accounted for by appropriate adjustment of the company's leasehold investment account. Should a date prior to December 31, 1933, be fixed for this purpose it would necessitate an adjustment of the accounts in respect of reassignments between that date and December 31, 1933, and accordingly, would affect the statements presented herewith.

"In accordance with the original policy of the company no provision has been made on the books, or in the accounts submitted herewith, for depreciation of the company's physical properties or for depletion of the leaseholds and gas reserves, as it was the intention to charge operations with the current amount of the sinking fund requirements for the retirement of the bonded indebtedness, beginning in 1934 and ending in 1946. Subsequent to December 31, 1933, the question of depreciation and depletion has been reconsidered by a special committee, as a consequence of which, we are informed, the accounts are to be adjusted to reflect charges to operations based upon appropriate rates and such charges are to be applied retroactively to the commencement of operations January 1, 1932."

1899 We discussed the omission of any provision for depreciation or depletion with the management of defendants prior to making the report from which I have just read. As was stated there, the company advised us they were going to look into the matter inasmuch as we had brought it up particularly, but that they could not do so in time to have anything set up in the 1933 accounts which we were then reporting on. They stated that if any changes were made thereafter on the matter of depreciation and depletion, they would be made retroactive. Subsequently in 1934, the matter was discussed, and the 1934 accounts showed that it had been given consideration, and the method adopted was applied retroactively.

The management discussed with me their reasons for not having made any entries of that character prior to the time I was discussing the situation with them. It was the feeling of the officers that the sinking fund requirements of the bonds would take care, as far as they were concerned, of this depletion, depreciation, or whatever they liked to call it. In their minds they were thinking in terms of the sinking fund requirements under the Indenture rather than the depreciation as such of the properties.

They stated to me, or I knew from the records, that the bonds were owned by the stockholders. I talked to Mr. Floyd C. Brown about these matters. My discussions were with him on every occasion. There may have been others in at different times, but mainly and at all times I was conferring with Mr. Brown. He was speaking as general manager of the company, and when I refer to the management, I am referring to Mr. Brown. If others were there, it would include them, but my talk was with Mr.

Brown, and anything that may have been submitted to me for discussion or for information was with his knowledge and approval and with his consent or direction, as is customary.

You ask what observation Mr. Brown and the others with whom I was talking there made concerning the ultimate ownership of the earnings of defendants after the payment of operating expenses. I don't know as I could answer that as such. The whole picture was a closely held corporation. The bonds, I knew from the records, were held by the participants. Any ultimate profit or loss would accrue to them through the equity securities, which consisted of common stock. It was their picture. They were not concerned with outsiders. There were no outside stockholders, no listing requirements. It was a matter in which they could do as they pleased, and we merely reported on what they had done, but made suggestions for the consideration of other things which eventually they did give thought to.

In discussing the subject of depreciation with them I was speaking of depreciation which applies to any industry, for that matter, that has an investment in fixed assets which are used up in the course of their business. Depreciation reserve is a charge made to operations over a given period of time, which is intended to recover the amount invested in the fixed asset which is used up or worn out in that time; in other words, to recover the capital investment within the useful life of the property.

1900 As depreciation is applied, it would be the physical life of the property equipment. In discussing with the management the fact that they had not set up any reserve for depreciation, I was addressing my suggestions particularly to the depreciation of the physical property.

I did not fix the rate at which they started to set up this depreciation of the pipeline and other physical properties of the Pipeline and Texoma Companies other than leaseholds. After I brought up the matter or suggested the matter for discussion, the company officials, through the committee that looked into that matter recommended that 2½ per cent be applied to the pipeline and other certain percentages to the other physical properties. These percentages varied according to the nature of the asset, but for the natural gas main line and branch lines, the depreciation rate recommended was 2½ per cent. In fixing the rate of depreciation of the lines and the fixed assets, the subject of the reserves in the Panhandle from which defendants were obtaining their gas did not enter into the discussion in any way. We discussed the matter of the depletion of the reserves about the same time. That subject came up only in connection with the discussion of depletion. We had the circumstances of the gas field and the conditions in the gas field as reported to us before us all the time we were talking about the depreciation of the physical properties. We made no examination into the gas fields at all, we merely based our opinion on the figures available from the companies' files and the figures submitted to us in the discussion of the situation.

When the committee made their recommendations, I was consulted in the matter of setting up the depreciation reserve. At that time I reviewed the rates to see if they were reasonable from an accounting standpoint. The rates with the exception of that for the pipelines were in general within the ranges which were reasonable. I had no knowledge of the pipelines and I took the liberty of consulting one of my partners as to what he thought was a reasonable rate for the pipeline. He disclosed to me that forty years was a reasonable life and I was satisfied that 2½ per cent was not out of proportion.

I was not particularly concerned with the field at the time I agreed to that 2½ per cent because I had no knowledge of the life of the field. So that there may be no misunderstanding, the gas reserve which the company had was not expected to last 40 years, but that of itself would not be a factor which would make me decide on any additional rate of depreciation if I were satisfied that the physical life of the pipes would be 40 years. I was not approving a reserve which in my judgment would return to the companies the investment in the pipeline and other physical properties within the life of the reserves of gas from which they were producing and transmitting gas at that time, because the gas reserves they had then available and acquired was but one factor. There is another factor which any business man would invoke if he had a pipeline that would last longer than his present reserves; he would endeavor to buy additional reserves if available to use in the remaining life of the pipe. So that the factor of the reserve might not determine the ultimate conclusion of the operations. The available reserve might be extended if they could acquire additional acreage. Under these circumstances, I was satisfied to have it set up on the basis of physical depreciation.

Mr. Brown at that time was quite concerned with some things that were going on down in the Panhandle field about stripping which was, as I understood it, wast-
1901 ing the available gas reserves. If allowed to go on
without any interruptions or without cessation, this stripping might be a very serious factor in the life of any company drawing from those fields, and one thing or another. In my consideration of the problem, I did not make any allowances for that factor of gas wastage for the reason that in determining the reserve which it was decided to use as a means of fixing the depletion rate an attempt was made to be conservative. It was below the figure of reserve which the various surveys had indicated to be there. The factor of safety was allowed in an attempt to be conservative in setting up the unit rate of depletion. The company fixed the rate at which depletion as originally set up on the books was figured. However, the rate was based on a method which I suggested, as follows:

In order to get a convenient accounting rate and a convenient method of taking care of this depletion, I tried to strip it of all frills and difficulties of recomputation. To do that, it was my thought, and I so suggested that they take some date as of which they should consider the acreage then held as available acreage for the purposes of this computation. They should then take the total cost of all of the acreage; because up to this time no change had been made on the books for the acreage surrendered. By that I meant that they should take all of the acreage as of some date as representing the total cost, which was subsequently fixed at January 1, 1933. However, the date is not as important as the fact that a date was taken. The number of acres then at that time was divided into the total cost of some $15,000,000 and it produced a figure of $65.548 per acre. That was the average cost of the acreage still retained at the date last mentioned, on the method I suggested.

Thereafter, any surrender of acreage was to be deducted from the total figure of cost at the same acreage value, $65.548.

At that time, it was contemplated that other acreage would be surrendered. It was not known how much would be surrendered. It was not my thought in recommending the setting up of the accounts on that basis that when this acreage was surrendered it was worth $65.548 per acre. That was obviously not considered at all. An average doesn't represent true value; and by any process of reasoning, that which you give away as valueless to you is obviously of less value than that which you keep, so that the very fact that it was surrendered was an indication that it was worth little or nothing, and certainly not anywhere near $65 an acres. The value would lie in what was left.

It was not intended by me that the system of accounting that we set up there would reflect the value of the retained acreage as of any given date subsequent to that time. The value at which it remained on the books would not be any indication of the value of that retained acreage.

Recross Examination Interposed by Mr. Slaff.

None of our accounts were designed to show the value as against cost. In this particular case, the original cost of $15,000,000 was set up. From then on, by the use of an average and a variation in the accounts for the surrendered acreage on that average, they ceased to have even the dollars representing the true cost of the balance of the acreage. The applying of this average as the acreage was surrendered was a convenient accounting method. We were not concerned with problems of value.

1902 *Redirect Examination by Mr. Morgan* (**Resumed**).

We were not concerned with the problems insofar as the accounting cost of the retained acreage was concerned. We were concerned only with the result of a method of accounting. It was my understanding at the time I recommended that method of accounting that in acquiring that acreage they considered that the acreage which turned out to be desirable would cost them the full amount that they paid for all of it. That was the understanding they put up to me in that discussion. If they had only had half of the acreage left after the weeding out process was completed, that was all that they were after originally in their acquisition—all that was useful to them. That which was not useful to them was surrendered as it was found to be useless to them.

Recross Examination Interposed by Mr. Slaff.

That information or understanding of mine was based simply on that conversation with Mr. Brown and perhaps other officers and members of the management of the company. I made no personal review of the situation because I am not competent to do that.

Redirect Examination by Mr. Morgan (*Resumed*).

In response to Mr. Slaff's question, I was referring to what they told me back in those days when I was setting up that system of accounting dealing with the subjects now under discussion. I was not referring to what they told me in the last month or the last week.

I did not finish the matter of the unit rate. I got to that point where I stated how the average acreage cost was determined for accounting purposes. The next stage was the matter of reserves as of the day the acreage was determined, the gas reserve figure being submitted from the company's record at that time. That was taken as the available reserves as against the available acreage, and a division was made which produced a figure averaging approximately 12,000,000 cubic feet per acre. I did not assume in arriving at that computed reserve that every acre they owned had 12,000,000 cubic feet of gas under it. That was an unknown factor. That was just an arithmetical result of dividing one figure by another, total reserve by acreage as conservatively stated. It is no indication of what each individual acre would contain, but the average was 12,000,000 cubic feet. Having fixed the 12,000,000 average, then that, divided into the total cost of the acreage, produced the rate of so much per thousand cubic feet. That rate on our recommendation was to be applied to all withdrawals of gas from the reserve by the company.

If that is carried to its conclusions, and there are no interruptions, no other factors to consider, then by the time the field is exhausted, if the reserves taken of 12,000,000 cubic feet per acre are proved to be a true and correct average, the total investment will be recovered. That was the thought that predominated in my suggesting this method. I was thinking about a convenient accounting method rather than an attempt to evaluate, if they could be evaluated, the various acreages and the various volumes of gas in the various acres, which, as I say, if they were determined, would have involved constantly changing each unit rate of depletion, and it might vary the earnings quite considerably between years if one year the production was from a very high value acreage, and another year from a low value acreage, so the idea was one of convenience rather than a reflection of anything in the nature of value.

1903. As a result of these two entries which I have described, the retirement and the depletion would arrive ultimately at a point where the gas produced by these companies will be used up as of the time the company ceases its operations down there. That would mean that the company itself would have produced a quantity of gas which would amount to 12,000,000 times the number of acres that it owned as of January 1, 1933. If it turns out that the subsequent developments disclose that Texoma is not taking out of these reserves all of the gas that is going out from under them but that large quantities of gas, totaling, as I remember the record, 60 per cent of the total that has gone out have been drained back to the wells and leases of other parties, this depletion reserve would not accumulate by the end of the field's life reserves sufficient to take care of the total reserves purchased by Texoma in that field in the beginning. It would be short to the extent by which these extraneous withdrawals had depleted their reserves below that conservative figure fixed for the determination of the unit rate. If as a matter of fact large quantities of gas have been drained off to other leases, that accounting entry there under the heading "depletion" does not truly reflect the amount of depletion of those leases as of this time or as of any particular time between the setting up of these reserves and the present time.

Recross Examination Interposed by Mr. Slaff.

If the reverse were true and if Texoma were draining gas away from its neighbors' acreage, the defendants would get more gas than that against which the reserves were set up.

Redirect Examination by Mr. Morgan Resumed.

The basis of setting up depletion has continued from that time down to the present date with the exception that where the company has acquired additional acreage, then insofar as the cost of that additional acreage varied from the $65,548 per acre, bringing it into their total picture varies the average per acre and the unit rate of reserve. The same principle of accounting, however, has been employed right down the line to the present date. There have never been any adjustments made to take care of the drainage to or from the reserves originally contained under the Texoma acreage as set up on the books in the beginning. In making that statement, I can only speak to the end of 1938. We have not the figures on 1939 yet.

The original schedule of depreciation set up in 1934 as above stated and adjusted back to the first of January, 1932, has not been continued from 1934 down to the present time. The pipeline rates were changed from 2½ per cent beginning January 1, 1938 to a composite rate of 4 per cent. They were adjusted at the end of 1938 back to the first of that year. There were some changes made in the depreciation rates on other properties, what they were and the amounts, I do not recall offhand. They are in the report here if it is of interest to you. I listed the changes there showing the rates to which they were changed and the previous rates. In connection with my examination of the companies' records, I was informed that the rate set up in 1938 was the result of a revision of their depreciation policy to conform with the settlement made with the Federal Income Tax authorities. The books were simply changed to meet the figures on which a compromise had been reached with the Federal Income Tax authorities. This compromise and settlement, however, affected only the Natural Gas Pipeline Company of America's depreciation rates, the Texoma's books were treated a little differently. I believe the rate of 2½ per cent 1904 continued on the Texoma (examining papers) yes, 2½ per cent was the rate applied on the Texoma books for pipelines. The other depreciable properties of Texoma were carried as they were fixed in the 1934 set up. The reason for this was that no similar compromise arrangement with the Income Tax Department has been made on behalf of Texoma, as I understand it. The company officials can answer better. That has not come up yet, inasmuch as those things only arise when they are showing taxable profit. As long as the company is showing losses, the day of settlement of depreciation and depletion and other rates of that kind is usually deferred. The Texoma of course under the terms of its Indenture is operated as a non-profit corporation. (Motion by counsel for the two commissions to strike all of the testimony of Mr. Cooke denied.)

Recross Examination by Mr. Booth.

We have been the regular auditors of defendants since the making of the audit for the three years and seven months ending December 31, 1933. We prepared the audit from which I have read here and we have prepared annual audits of the books of these companies since that time.

Yes, in our report dated March 22, 1934, from which I read here, I pointed out and discussed the fact that the companies' books reflected no provision for depreciation or depletion. The income account and the balance sheet in the audit report also notes this fact, I believe. Yes, it is noted here that the audit is "before depreciation and depletion." I made these notations in the report purely because and only because provision for depreciation and depletion had not been made; and we thought some provision should be made and we recommended that it be considered.

Yes, at the time I made the audit in 1933 and 1934, I would normally have expected to find some provision for depreciation and depletion in any company for any year in which it owned assets which are depreciable. Yes, my method of determining depletion expense was the so-called unit method, that is for each unit of gas withdrawn during the accounting period, so much is charged to depletion expense. The number of cubic feet multiplied by the unit rate. I would expect such charges to be reflected on the books year by year as the gas was withdrawn. If I were making a re-computation now, I would take the figures that are available based on an increased knowledge gained in the intervening period of five years or so. For instance, the amount of the acreage surrendered is now different than it was then, therefore, I would have a new factor, that is not a new but a different factor from that used in the 1933 base. I would require the sum total of acreage which has been surrendered and would suggest that that be deducted from the total original acreage. Then I would divide that present acreage into the total cost, that would give me a revised or up-to-date average value per acre, book value or cost. I don't like to use these terms because you put a different construction on them. It is the original cost of the whole field divided by the useful and available acreage. That is what I am trying to say. I would ascertain the average cost on that basis, then from the reserve point of view, the reserve would be adjusted, that is, the original reserves would be adjusted to what is considered by those who have a better knowledge of it than I have, the present total reserve ~~in that~~ acreage. On that basis then a unit charge could be determined that would be more accurate now than that which was determined five years back.

In other words, my objective would be to take as the base the reserves originally under the acreage now retained and deplete that original reserve down to what its present content actually is. I would have to rely on the figures given, but that would be the theory that would be 1905 applied. That which has been withdrawn would have to be considered in my total reserves to get the unit rate, and that which has been withdrawn from the reserves would be charged to operations at that unit rate and credited to the reserve for depletion.

You read from page 10 of our first audit report the following language: "it was the intention to charge operations with the current amount of the sinking fund requirements for the retirement of the bonded indebtedness beginning in 1934 and ending in 1946." You ask how this would be done. That was the companies' problem. I was not acceding to that, as you can tell from the fact that I take exception to that method and suggest depreciation and depletion; but it was Mr. Brown's thought that the charge to operations of the amount each year called for under the sinking fund would take the place of depreciation or depletion. In other words, if he could recover a figure each year which would enable him to pay off that sinking fund requirement, he would then have accomplished the purpose in his mind of a reserve for depreciation and depletion. I was not stating that as a fact, but merely the explanation, as I recall, Mr. Brown gave me at that time.

Yes, under his method, he would have accomplished what would ordinarily be accomplished by a depreciation and depletion charge, namely, the recovery and the return of the investment. That, generally speaking, is the purpose of it. You ask if that is what I understood his original purpose to be in charging operations with the current amount of the sinking fund requirements. I would prefer that Mr. Brown answer that, as he is the only person who can say what his intentions were. I did not approve of the method at all because it did not reflect depreciation and depletion as professional accountants require it to be set up, and I so stated, and as a result of that, the matter was given consideration. I think it should also be mentioned that under the agreement between the defendants which provides for payment to Texoma by the Natural Gas Pipeline Company, no provision was made for depreciation and depletion, but a sinking fund sum was allowed to be included as a charge. So I think that may have had something to do with Mr. Brown's thoughts on the matter. I would prefer that he should answer that himself.

You ask if it was intended to accomplish in a general way what depreciation and depletion would accomplish. No, I don't think that was it. The sinking fund provisions were not drawn up with any idea of being equal to depreciation and depletion, or of accomplishing the same purpose. They were drawn up with the idea of recovering over a certain period, by the amounts stated therein, a certain sum of money representing the amount of the original issue of bonds. You ask if the amount of the original issue of bonds represented the investment in the property and if the function of the sinking fund would be to return the original investment which, as I have indicated, is the object of depreciation and depletion. That is true if the sinking fund provisions were workable, but here is the point that should be considered, that the sinking fund was on a gradually increasing scale. It started very low annually and went to very high figures and though I cannot go into a discussion of the future of that company—it is not my province and was not at that time—I did bear in mind that these amounts in the later years were so high that the company might not be able to carry on this method of setting aside this amount to be considered as depreciation and depletion, because they probably would not be able to stand such high figures.

I do not know what you mean by your last question. If they are not making enough money to set aside the sinking fund in those later years, when it gets heavy, there obvi-

ously is nothing available for dividends, so I was not
1906 looking at the dividends. You are speaking of the recovery of that capital through the goal of a depreciation charge called a sinking fund figure. It may work out; but if the company's earnings do not reach those amounts, if they are not sufficiently high in amount to pay that sinking fund, they may find themselves in a hole there.

The object of the depreciation and depletion was to equalize the charges annually and arrive at the same results by accepted methods of annual charges which would be set up on the books, regardless of whether there was the cash there to set aside for it or to utilize for that purpose. As a matter of fact I think if you look at the years before 1934, you will find that before depreciation was set up they had quite a deficit in the sinking fund.

You ask if my recommendations would have been any different if I had found the same situation true as far as their failure to provide for depreciation and depletion was concerned for a gas company subject to the jurisdiction of the Illinois Commerce Commission in 1934. In any case where I found depreciation or depletion had not been provided, regardless of commission regulation as to accounting, I would draw attention to it. You know as well as I do that reports are coming out year after year on utilities which state that the retirement provision does not necessarily reflect the exhaustion or the wear and tear of the property. It is prescribed by the Commission and so it is set up, but that does not necessarily mean that we as accountants consider that, or for that matter anybody considers it the true accumulation of depreciation, so I do not want to answer your point by any yes or no, because I would have to look into each individual situation. It makes no difference whether the company was subject to regulation or not as to whether it is providing depreciation. It either is or it is not, regardless of whether a commission sets one thing up or says another thing shall not be set up.

My reaction would be identical whether or not it was an industrial, a utility, or any corporation that had assets that were consumed partially or wholly in its operations, it should set up a depreciation provision.

The retirement of the bonds would normally affect just the balance sheet because it is a depletion of the cash and a corresponding reduction in the bonded indebtedness.

The depreciation and depletion is obviously normally reflected by the charges into the income account.

Redirect Examination by Mr. Morgan Resumed.

The bond indenture and the terms of the bonds themselves provided for payment in 15 years from about the time of the beginning of operations. Those depreciation and depletion reserves do not accomplish that purpose. The depletion reserves will only do so if the reserves are drawn to the extent that the number of cubic feet multiplied by the unit rate equals that sum. When I am speaking of withdrawals, I am speaking purely of Texoma's withdrawals for its own purposes.

The fact that defendants did not set up depreciation at the beginning of operations has not affected the property value of that property or the condition of that property as at this particular time. (Objection by Counsel for Illinois Commerce Commission.) The fact that on the books a reserve for depreciation is set up by a charge to operations does not attempt to reflect the physical value of the property as of any date.

1907 Yes, it has been about 5 years since I first had this matter up and was discussing the matter and gave that report. You ask if as of the time they set up this depreciation rate of 2½ per cent on the pipeline property which was about three years after the pipeline operations had started, it was my thought that by the first of January, 1940, which is eight years after the pipeline operations had started that the condition of the pipeline would then be 80 per cent of its original condition. (Objection by Commission Counsel overruled.) My answer to that question is that the application of any annual average rate does not attempt to set up during the physical life of that property what its actual value may be. It is merly an average rate which starts with the investment in the early stage and leads if properly applied to the recoupment of the investment at the end. I am not in a position to state the rapidity with which physical depreciation may accrue. It is merely a recognition for accounting purposes of the necessity for a recording of that depreciation spread over the physical life.

Recross Examination by Mr. Slaff.

The annual amount is not supposed to represent the actual loss and serve as the value of the property because that it something that cannot be determined by arithmetic.

In using the expression "not actual annual loss and serves as value" I am trying to distinguish between physical and accounting depreciation of a machine which is running, which cost a sum of money and will last 10 years. That would necessitate the application of a depreciation rate for accounting purposes of 10 per cent per year. That machine may run very little one year, another year it may run quite a little, quite more than the average. I cannot say how the depreciation is affected by the varying usage, but I think there is general agreement that the machine does not physically depreciate purely in relation to the time that you have had it on your floor.

Yes, that depends upon what meaning I attach to the word "depreciate". I am speaking of accounting depreciation rather than physical depreciation; and the two do not necessarily strike the same curve or straight line or whatever it may be as the measurement. I am obviously not in a position to attempt to state the physical depreciation factor or the depreciation due to a variety of circumstances, such as obsolescence, inadequacy, and so forth.

1908 CHARLES W. SMITH, a witness for Federal Power Commission, recalled for further cross-examination testified as follows:

(January 10, 1940.)

Cross-Examination by Mr. Morgan:

I have been with the Federal Power Commission since July 1, 1936. Prior to that time I was with the Maryland Commission for a number of years in a position somewhat similar to that I occupy with the Federal Power Commission. In the Maryland Commission, my duties had to do largely with electric, gas, street railway, water, and telephone utilities. There was one company which distributed natural gas in the state of Maryland and that was the only company which involved the questions which are associated with the natural gas companies. Those questions had to do with a distribution company; but this company purchased natural gas from an affiliated company and we had to go back to the seller. That was in an informal rate case.

Several years ago, the Public Service Commission of

Maryland and the Public Service Commission of West Virginia had joint hearings involving two or more companies, including the company which distributed the gas in Maryland. It involved the companies which produced the gas, because both of the state commissions were interested in the cost of the production, and after these commissions each rendered separate opinions, it was necessary for me from time to time to go back and study the case in the light of current facts and advise the commission with regard to them. That took me back, of course, to the cost of production to a certain extent. The name of that company was the Cumberland and Allegheny Gas Company which distributed gas to Cumberland, Maryland. It was bringing gas from West Virginia. I do not know the exact distance over which it transported gas. I would say that 3000 miles is a rough approximation of the distance.

Upon coming with the Federal Power Commission in 1936 and up to the summer of 1938, I was dealing exclusively with electric regulation. Since 1938, the natural gas pipeline engaged in interstate commerce have been added to the enterprises or institutions made subject to the Commission's jurisdiction under the terms of the Act. This is the first rate case that has actually been on trial under that Act. There is a case in northern New York which was called ahead of this but did not reach this phase as quickly as this one. I do not know whether the case actually started before this one or not; but I look upon this case as having progressed much farther than the New York case at this stage. The case up there has passed the jurisdictional and other preliminary matters at this time. The initial proceedings were quite largely jurisdictional questions, but then they were followed up with questions, for instance, as to the source of gas and the gas reserves, and got down to depletion. They gradually got into all of the phases which we have discussed in this case. The commission has not put on its testimony as to engineering, accounting, and rate of return studies.

Cross-Examination Interposed by Mr. Booth.

As a matter of fact since the Natural Gas Act was passed we got into rate cases, and I have been deep into natural gas rate cases since that time up until the present. I would say that since the Natural Gas Act was passed, or at least shortly thereafter, up until the present date, 1909 the major part of my work has been devoted to natural gas companies, involving many other companies in addition to this one.

Cross-Examination by Mr. Morgan Resumed.

In my Exhibit No. 186, I listed 31 gas companies, I believe. In my Schedule 5-A are listed 7 companies. You have asked that I name those which are confined to production or transmission activities, to the exclusion of distribution. The Houston Gas Company is a gas company which purchases and produces and transmits and sells at wholesale. The Lone Star has retail and wholesale. You probably want that excluded because of the retail business. The Panhandle Eastern Pipeline and Southern Natural Gas Company are transmission and production companies. On Schedule 5-D, I think the El Paso Natural Gas Company and Houston Gulf Gas Company would fit that description. I believe that is all.

On Schedule 5-F of the same exhibit, the El Paso Natural Gas Company, the Houston Gulf Gas Company, the Interstate Natural Gas Company, Southern Natural Gas Company and the Memphis Natural Gas Company fit the description of being engaged in transmission and in production to the exclusion of distribution. The Mountain Fuel Company sells at retail.

On Schedule 5, I have in mind the Arkansas-Louisiana Gas Company which has large transmission lines and production fields and sells a good deal at wholesale, and yet it sells a great deal at retail. We will probably exclude the Arkansas-Louisiana. Canadian River Gas Company would be another of the companies, as would also Chicago District Pipeline Company, the Cities Service Gas Company, Colorado Interstate Gas Company, the El Paso Natural Gas Company, the Hope Natural Gas Company and the Houston Gulf Gas Company. I would also name the Interstate Natural Gas Company. I have a little difficulty with the Lone Star Company, which distributes gas at Fort Worth, otherwise, it would be in the category but because of its retail sales in Fort Worth, you would probably want it excluded. The Memphis Natural Gas Company and the Mississippi River Fuel Corporation are transmission companies and have no producing fields. The Natural Gas

Pipeline Company of America, the Southern Natural Gas Company, Texoma Natural Gas Company, Northern Natural Gas Company, Panhandle Eastern Pipeline Company, the United Fuel Gas Company, and the United Gas Pipeline Company are all producing and/or transmission companies, to the exclusion of distribution. The Northern Natural and the Panhandle Eastern may have a small amount distribution. I believe that completes the list.

You ask if I am familiar with the physical conditions encountered by each of those companies listed in Exhibit 186 under Schedule 5 and the subdivisions thereof which I have classified as producing and/or transmission companies. I was familiar with the source of supply but as to the topography, I have a general knowledge that any person who has read some geography would know about it in the United States. I have just the information that I would get from an Atlas, except I have been to some of those places. I have made no detailed study of course. For instance, I have been up along the Mississippi Valley. I know something about the pipeline company which serves St. Louis in a general way from having seen the territory in an automobile and from a train window; but I would not know anything about the details of the physical structure of the earth, of the rivers, the detail of them, the depth, the width and so on.

At the time I prepared this exhibit, I made a study as to the sources of supply generally as to the fields. I knew the fields which supplied the lines. I have some information as to which of them depend upon one trunk line largely for their handling of that gas to the market, as opposed to those which have a system or network of pipelines connected with a great many fields. I know of course
1910 that the Panhandle Eastern and Northern, for instance, take gas from the Panhandle Field and from the Hugoton Field. I am not sure that the Northern takes also from the Otis Field in Kansas. It was the Panhandle and Hugoton field that I was especially familiar with as the source of supply for the Northern line. Colorado Interstate takes its gas from the Panhandle field. Lone Star has a wider source of supply than the other companies you have mentioned. I would classify it as a network. You are going beyond my depth when you ask me whether it can switch gas from one part of its system to another to meet shortages and things of that kind. I don't know which of these companies are in position to do that.

You ask whether I know the location of the markets of the Panhandle Eastern. Detroit is the final market. It serves a great many places enroute. I think Springfield, Illinois is one place and Indiana, one or two places, and then it goes on up to Detroit. It serves some communities in Kansas, if that is important. I have that information in my office and can give it at great detail. It has a large market, yes, if you consider the ultimate market and the places which it serves. It does not have a pipeline to Detroit. The terminus of its line is at a point near Dana, Indiana, adjacent to the Illinois-Indiana state line. There it turns the gas over to a line belonging to the Michigan Gas Transmission Company.

The Panhandle Eastern line runs in a general direction to the northeast out of the Texas Panhandle Field across the States of Oklahoma, Kansas, Missouri, Illinois, and Indiana. It crosses the Mississippi River. I imagine it crosses the Missouri, I don't have a very good map in front of me. I would not be able to go any farther than that. I don't know whether it starts in Moore County, Texas north of the Canadian River or not. It starts in the Panhandle field and goes in a northeasterly direction.

The Colorado Interstate runs north out of the Panhandle, up through the northeast corner of New Mexico, and on into Colorado. I do not know of any large rivers that that line crosses. I don't know anything about any topography of the country there that would indicate that there were any extraordinary hazards confronting that company.

The Cities Service Company runs out of the Panhandle to Kansas City and also takes from other fields in Western Kansas and Oklahoma. I do not know whether it crosses either the Missouri or the Mississippi River. You are getting out of my field when you get down to the topography of the country through which these pipelines pass. I do not know whether it delivers the gas to the Kansas City Company on the east or the west side of the Missouri River.

The Northern Natural Gas Company comes out of the Panhandle field and also takes gas from the Hugoton field. It crosses the Missouri River, I imagine, but it is confined to territory west of the Mississippi in its delivery points.

The transmission lines of Lone Star Gas Company are generally in two groups, the main group from the southeastern extremity of the Texas Panhandle to Ft. Worth and

Dallas, and there connects to the network of the transmission and distribution lines which extend through the central part of Texas and southern Oklahoma. The secondary group extends in a southwesterly direction from a point from Brownwood, Texas, to San Angelo, Texas, to which gas is delivered from the Coleman County and
1911 Brown County fields, westerly from San Angelo, Texas, to the Big Lake field, and thence to Girvin, Texas. I do not know how far it is from Wheeler County, Texas to Ft. Worth or Dallas. I know the company owns over 4,000 miles of mains and field lines, according to this report to the Federal Power Commission. That is the whole system. That particular line running from the Panhandle field down to Ft. Worth and Dallas would probably not be more than a few hundred miles long.

1912 S. E. CAMPBELL, witness for defendants, called for further redirect examination, testified as follows:

(January 10, 1940.)

Redirect Examination by Mr. Morgan.

I was called to testify on Exhibits 141 and 142 introduced in this case. In those exhibits, I used as our allowance for amortization an amount which together with interest figured at the rate of 1.35 per cent per annum compounded annually, would yield the total amount shown in those exhibits as the amount to be amortized up to the end of 1954, beginning January 1, 1939. I have prepared a revision of part of that exhibit.

(At this point counsel for the defendants produced a sheet described as a "revision of page 1 of Exhibit 141" and requested that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit 210. The Examiner also authorized the witness to add to the top of the document the words "Revision of page 1 of Exhibit 141".)

Exhibit 210 is a revision of page 1 of Exhibit 141. It changes the figures in line 33, both in columns 2 and 3, and it changes the figures in line 34, in column 2 and column 3, and the figure shown in line 35 of column 3.

In Mr. Delafield's testimony on rate of return, he stated that he would prefer and at this time would be more apt to choose 2 per cent as the proper interest rate for sinking funds; and on the basis of his testimony, we have simply revised page 1 of Exhibit 141 to include 2 per cent interest, compounded semi-annually, in place of 1.35 per cent which was the rate of interest, compounded annually, used in the original page 1 of Exhibit 141. So in computing the amortization allowance instead of using as an interest rate of 1.35 per cent compounded annually, I have in Exhibit 210 used a compound interest rate of 2 per cent compounded semi-annually. Compounding the interest semi-annually is a more conservative procedure and results in a lesser amortization allowance. I believe Mr. Delafield testified that that was the way he would do it at the time he testified concerning the 2 per cent.

I have a similar revision of a page of Exhibit 142.

(At this point, counsel for defendants produced a document described as a revision of page 1 of Exhibit 142 and requested the Examiner to permit the witness to add to the title thereof the words "Revision of Page 1 of Exhibit 142," and to cause the document as thus amended to be marked for identification. The Examiner authorized the addition to the caption and directed that the document be marked Exhibit 211.)

Exhibit 211 is the same as page 1 of Exhibit 142, with the exception of the revision of some of the figures. The first difference occurs in line 21 entitled "Value of gas reserves". On Exhibit 142, we use the value as submitted by Mr. Wallace of the gas reserves, which was later found to be in error and was corrected on Exhibit 146, and we have substituted in this revised sheet, the revised gas reserves value, shown in the last mentioned exhibit. The original figure was $13,288,552, and the revised figure is $13,334,775.

As a result of that one correction, that changes the figures by a like amount in line 25, columns 1 and 2, the 1913 figure in line 26, column 3, the figure in line 32, column 2. It is also a revision of the figures in line 33, columns 2 and 3, the figures in line 34, columns 2 and 3, and the figure in line 35. The changes in lines 21, 25, 26, and 32 are merely to conform to that correction by Mr. Wallace in the arithmetic of his exhibit from which the figure in line 21 of Exhibit 142 was taken.

In addition to the slight effect of the change in line 21, the figures in lines 33, 34, and 35 have been changed as the result of substituting a 2-percent interest, compounded semi-annually, in place of a 1.35 per cent interest, compounded annually, as used in computing the amortization allowance in Exhibit 142. I have computed the amortization allowance on the 2 per cent semi-annual basis for the same reasons that I gave for computing it on that basis in my discussion of Exhibit 210.

(Exhibits 210 and 211 were received in evidence, subject to the objections and exceptions of counsel for each of the two commissions to Exhibits 141 and 142 respectively.)

I am familiar with the document from which Mr. Ostrander read some time ago, described in the record as a report submitted to the National Association of Railroad and Utilities Commissioners at its 50th annual convention in New Orleans, Louisiana, November 15 to 18, 1938. That Association has had another annual meeting since 1938. You have handed me a document styled "National Association of Railroad and Utilities Commissioners, Report of Special Committee on Depreciation" which was submitted to the Association last named at its 51st annual convention in Seattle, Washington, August 22 to 24, 1939. That is the same Association referred to in the document from which Mr. Ostrander read. Aside from variations in the personnel, the document filed with the Association in 1939 is a report of the committee which filed with the Association the report in 1938 from which Mr. Ostrander read.

The names of the members of the committee submitting this report are found on page 66. They are as follows: Asel R. Colbert, Wisconsin, Chairman; Steuart Purcell, Maryland; W. A. Dittmer, Illinois; A. B. Greene, Florida; Herbert J. Flagg, New Jersey; John C. Damon, Securities and Exchange Commission; W. J. Norfleet, Federal Communications Commission; E. H. Merrill, Utah; Claude M. Smith, New Hampshire; C. W. Smith, Federal Power Commission; A. J. Greer, Washington; G. C. Boyer, Virginia; C. Radford Berry, Pennsylvania; Francis T. McNamara, Connecticut; R. A. Wehe, California; and W. C. Loss, Colorado. This list shows 16 men on this committee. The report is signed by 9 of these men. Some of the names on the two committees are identical. Among those I find on the committee in both the year 1938 and 1939 are: Asel R. Colbert, John C. Damon, W. A. Dittmer, Herbert J. Flagg, A. B. Greene, E. H. Merrill, and W. J. Norfleet.

Beginning near the middle of page 25 of the 1939 report of this same committee to the association above referred to under the caption "Straight line or sinking fund method may be used" and the succeeding two subdivisions, the second called "Sinking fund interest rate", and the third "Advantages of the straight line method", we read as follows:

(Counsel for the two commissions objected to the reading into the record the following excerpts by the witness who is not offered as a witness on depreciation and their objections were overruled.)

1914 "Straight line or Sinking-fund Method May Be Used:

"As a practical matter either the straight-line or the sinking-fund method, when properly used, accomplishes a spreading of the cost of depreciation. The former spreads the cost on a straight-line basis; the latter on a rising compound interest curve basis.

"If the sinking-fund method is viewed narrowly as the accumulation of a fund by means of annuities to cover replacement costs, it would appear incorrect to use it to record cost of present operations. To illustrate, the uniform consumption of a coal pile could not be accounted for equitably under a sinking-fund plan because when half of the coal was consumed its cost should have been charged to expense. Any method which failed to charge this cost to operation, on the theory that the deficiency would be made up by increased charges in the future, would be erroneous. If applied to utility plant, however, the sinking-fund method may be used if it is assumed, as stated hereinbefore, that the consumption of the investment in plant is progressing on a compound interest curve basis."

Under the sub-caption, "Recording of Sinking-fund Interest":

"Where the sinking-fund method is used the total annual depreciation provision required is the sum of the annuity and the interest. Both these amounts should be so recorded as to show operating income both before and after the inclusion of the interest component of the total provision for depreciation. This would make both corporate operating income and operating income which might be used by the regulatory authority in rate matters readily available from the income statement.

"The interest element of the sinking-fund method is sometimes charged as interest expense. This procedure is not desirable as it results in an overstatement of the earnings available for interest on bonds because gross income is determined before full provision for depreciation of the plant. Investment counselors often make adjustment in income statements to reflect the so-called interest increment of the sinking-fund method in depreciation expense, but small investors frequently do not have the benefit of such advice and are apt to accept income statements at face value. It appears particularly desirable that accounting regulations be such as to require a correct showing of earnings available for investors."

Under the sub-caption, "Sinking-fund Interest Rate":

"The use of an interest factor in the sinking-fund method raises the question as to the rate of interest to be used. The theory is sometimes advanced that it should be approximately the same as the interest rate for bonds, or from 3 to 4 per cent. This theory is probably based on the premise that the sinking-fund reserve represents the extent to which customers have contributed to the capital of the utility through depreciation charges included in service rates and that, therefore, they should be given credit for interest on about the same basis as bondholders.

"Others claim the sinking-fund interest rate should be the same as the rate of return. This view is probably based on the theory that the sinking-fund interest rate should be determined from the earnings on depreciation funds. Since these funds are, as a general rule, invested in utility
plant the interest rate indicated is the same as, or
1915 at least approximates, the rate of return.

"The interest rate to be used is particularly important in rate-making procedure, especially where the sinking-fund method is used with an undepreciated rate base. Here the problem is largely one of equity to both customers and investors and the picture must be considered as a whole, including the rate of return allowed by the regulatory authority. It is doubtful if a specific interest rate could be advanced which would be equitable in all cases. Probably the nearest approach to a general rule is that the sinking-fund interest rate might reasonably lie somewhere between the rate of bond interest on the low side and the rate of return on the high side.

"Insofar as accounting only is concerned, neither the arguments in favor of making the sinking-fund interest rate equivalent to the rate of bond interest or the rate of return is persuasive. The rate of consumption of service capacity is not dependent on the cost of money nor does it bear any necessary relationship to the earnings on the depreciation funds. The funds might be invested in plant and earn a high or low return, or even a loss; or in a separate fund with the same result. Again, in a given set of circumstances, they might be used to pay partial liquidating dividends on common stock to be employed by the stockholder as he saw fit. What happens to the depreciation funds, however, has nothing to do with the rate of depreciation of property. The cost of depreciation is not dependent on earnings but occurs regardless of whether any earnings result.

"Accounting for depreciation is concerned with the matter of spreading the cost of depreciation. Therefore, for accounting purposes, the interest rate to be used in connection with the sinking-fund method should be that which results in a compound interest curve estimated to approximate the rate of consumption of service capacity of the plant to the end that the cost of service capacity of plant be spread equitably."

That concludes the three sub-divisions which you asked me to read.

Recross Examination Interposed by Mr. Slaff.

On the first page of the report, which is on page 5 of the proceedings, the following language appears:

"This report should be considered as tentative as there are several matters which time has not permitted us to complete. Among other things, no discussion is presented covering the proper treatment to be accorded depreciation in rate proceedings or of court decisions relating to the subject. It is recommended therefor that this report be considered in the nature of a progress report for distribution to the members of the Association for their information, review, and criticism."

On the next page, the first paragraph reads:

"As pointed out, this report dealing as it does with a subject presenting so many controversial issues in regulatory matters, does not conform in all respects to the views of each individual member of the committee. However, it is believed that better understanding of the depreciation problem has been gained and that many parts of the report can be considered as acceptable to a majority of the committee.

1916 ***Redirect Examination by Mr. Morgan Resumed.***

I am the Secretary of both defendants and as such have the custody of and responsibility for the records and books of account of defendants. The accountants who keep the accounts are responsible to me directly and I am responsible for the keeping of the books of account. I have had those responsibilties with both companies since December, 1933. I was not Secretary at the time I first assumed these responsibilities. I was Assistant Secretary. I was made Secretary in November 1934. During the period from December, 1933 to November, 1934 my duties and responsibilities were the same as they are now. The Secretary had resigned prior to my taking up the duties of Assistant Secretary and there was no Secretary during that period when I was serving as Assistant Secretary.

At the time I became responsible for the keeping of the books of account under the title of Assistant Secretary, beginning about December, 1933, the company had not recorded on its books any depreciation, depletion or retirements. Those subjects received consideration immediately after I became responsible for the books of account. The matter was discussed with the Manager, Mr. Brown, and with outside auditors, Peat, Marwick, Mitchell & Co., who had been employed to audit the company's records from the beginning up to the end of 1933. The firm last mentioned is the firm in which John A. Cook is a partner. We talked to him personally about the matter. Yes, I know why the company up to that time had made no book provision for depreciation and depletion. The company started out with the idea of operating on a revenue or income basis, having certain responsibilities in mind which had to be met from their income after taking care of their operating and construction costs; these obligations being namely, bond interest and bond retirements under the sinking fund provisions of the indenture. Anything left after those, of course, was subject to disposal by the board of directors as they saw fit. This included the payment of dividends if they desired.

The company was a closed corporation. Its stockholders and bondholders were one and the same, so that any money produced in excess of the company's requirements for operation and construction would ultimately go to the same people, regardless of how the book records were kept. The life of the project was considered at that time to be about 15 to 20 years; and the management did not feel that depreciation and depletion reserves were necessary for use in the replacement of the property, and since they would not affect the amount of the income available for interest and bond retirements, they did not see any reason or any necessity for recording them on the books at that time.

Yes, it was possible to pay off their bond interest and the principal of the bonds as they matured without provision for depreciation and depletion. The provision for depreciation and depletion did not affect the cash produced by the company or the disposition of the cash prior to the time it was set up. Our change in policy during the year 1934 relating to depreciation and depletion was adopted to meet two criticisms that the company had received. One was through the Federal Trade Commission in their report on the investigation of natural gas pipeline companies, I believe under Senate Resolution 83, in which they criticized the company for not having recorded on their books, depreciation and depletion, and stated that under those conditions, the company could pay dividends out of capital. It had not paid any dividends at that time. They simply stated that it could. About the same time the outside auditors, Peat, Marwick, Mitchell & Co., were employed to audit the books of the two companies and they likewise criticized us on the same subject and along the same lines. The company did not feel that these
1917 criticisms were incorrect as far as the bookkeeping records were concerned, and agreed to adopt a policy that would meet their objections.

After a number of conferences with Mr. Cook and Mr. Brown in which a number of employes of the company sat, a committee of representatives of the owner companies was selected to consider the subject and arrive at a depreciation policy. Mr. Cook met with these representatives from the owner companies on one or two occasions, outlining his thoughts on the subject, and later this committee met in New York and arrived at the rates of depreciation that the company should adopt on its book records. These rates were arbitrary to begin with, as the various members had different ideas and they arrived at rather an arbitrary compromise based on the records that they had available on the past life of similar equipment in other properties. I mean the physical life. And they adopted rates that would correspond with those physical lives. I believe I have the schedule of rates set up for the different classes of depreciable property (examining papers). Yes, these rates, which are the same rates which were carried on our books up to the beginning of 1938, were:

Main lines 2½ per cent; compressor stations, 6 per cent; telephone system, 8 per cent; meters and regulators, 7½ per cent; other main line structures, 7½ per cent; branch lines, 2½ per cent; gathering lines, 2½ per cent; gasoline plant, 10 per cent; tools, 20 per cent; automotive equipment, 25 per cent; furniture and fixtures, 7½ per cent; laboratory equipment, 10 per cent.

We used those rates of depreciation relating them back to the beginning of operations on January 1, 1932 until the year 1938. In 1938, the rates as applicable to Natural Gas Pipeline Company of America, only, were changed, effective January 1, 1938. Not all of the rates were changed but several of the rates in addition to the pipeline rate were changed. The reason for this was that at the time we had concluded a settlement with the Internal Revenue Bureau on the depreciation rates they would allow for income tax purposes, and purely for a matter of bookkeeping convenience we adopted the rates that the Revenue Bureau had agreed to. That was a compromise agreement for the purpose of income tax settlement.

We did not make the same revisions on Texoma's books for the reason stated by Mr. Cook, that we have never made a settlement with the Internal Revenue Bureau as far as Texoma's depreciation allowances are concerned. We never had a taxable income on Texoma and therefore have not had a settlement with the Revenue Bureau as far as Texoma's books were concerned. We left the rates of depreciation just as they were originally agreed upon by the committee back in 1934.

All of the owner companies are represented on the respective boards of directors of the two defendants; that is, all owners of Pipeline Company are represented on its board of directors and all the owners of Texoma are represented on its Board of directors. That has been true all along.

Recross Examination Interposed by Mr. Slaff.

The rates applicable to the Pipeline Company's property in 1938 and 1939 were: mainlines, 4 per cent; compressor stations, 4 per cent, telephone system, 4 per cent; other mainline structures, 4 per cent; branch lines, 4 per cent; meters and regulators, 4 per cent; tools, 20 per cent; automotive equipment, 25 per cent; furniture and fixtures, 7½ per cent; laboratory equipment, 10 per cent.

1918 *Redirect Examination by Mr. Morgan Resumed.*

Those are the only rates that the settlement affected.

1919 At the time we set up those rates of depreciation in 1934, it was not the object of the management and the officials responsible for the records to set up reserves for the purpose of returning to the owners their capital within the physical life of the field from which Texoma produces its gas. Those rates have nothing whatever to do with the life of the field. The rates were based on the usual allowance for physical depreciation of the depreciable property affected by the rates, and contemplated a 40-year physical life for the pipeline itself. For the other equipment, the life was conceived to be 100 divided by the rate set up.

In the matter of making provisions for depletion, we were discussing that subject at the same time we were discussing depreciation with Mr. Cooke and Mr. Brown and the other representatives. Mr. Cooke made a recommendation on the procedure that he thought would be appropriate for the company to adopt as its depletion policy, and this suggestion of Mr. Cooke's was adopted. The representatives of the owner companies and the company officials agreed to that procedure.

The recommendation was that we should first establish a date when the operations actually started. That was one thing that was necessary, that we should determine a date, for bookkeeping purposes only, when the retirement of acreage released should start. And he outlined a procedure by which the book costs would be reduced for acreage retired, and the company furnished him an arbitrary figure on the average reserves per acre, to apply to his formula. This applied to acreaged owned as of January 1, 1933.

The total reserves based on the assumed content of 12,000,000 cubic feet per acre were divided into the book cost of the reserves, which gave us a depletion factor that was applicable to the acreage released. The company, for bookkeeping purposes, for reduction of the book costs to cover retirements, adopted the policy of taking the total cost as reflected by the books of all of the acreage and dividing that by the number of acres we owned on January 1, 1933, and arrived at a purely arbitrary average cost of $65.548 per acre.

We did not understand at that time that there would be no more acreage released after January 1, 1933. We knew we had already at that time released quite a number of acres, and there would still be more acres to release later. We had been releasing acreage all through the year 1933 and 1934 up to the time we fixed this retirement. We knew that that acreage already released was not in the property account at the time we made the adjustment. It was not our thought that we had released all of the acreage as of the time we adopted that policy that we would release. We realized we would release more as time went on. It was not our thought at that time that the acreage which we had released during 1933 and 1934 and which would be released after the time we adopted this policy was on the first day of January, 1933 worth $65.548 per acre. (Objection by Commission counsel overruled.) That we had no such thought is substantiated by the fact that we released it in place of selling it. We would have sold it if it had had value.

The amount of $65.548 set up on the books was the total cost of all of the acreage divided by the number of acres on hand at that date, namely, January 1, 1933. As far as the books are concerned, we have reduced the book costs for the acreage retired since January 1, 1933 at the 1920 rate of $65.548 per acre. Charging that off the books as we released it does not get our money back. The property account, so far as that acreage is concerned, in my opinion, does not reflect the cost of the acreage which we still retain.

Cross-Examination Interposed by Mr. Slaff.

When any utility retires any property, that act does not get it its money back.

Examination by Mr. Morgan Resumed.

With reference to the depletion rate set up at the same time, the same policy has been continued down to the present time. The only variation has been due to the fact that other acreage has been acquired at a different price than $65.548. In adjusting the total acreage cost to an average which would take into account acreage subsequently acquired, we have continued exactly the same method of calculating our rate of depletion.

Recross Examination Interposed by Mr. Slaff.

As a matter of fact that adjustment for subsequently acquired acreage makes a very small difference in the depletion.

Redirect Examination by Mr. Morgan Resumed.

This entry for depletion is made monthly. We set up in the depletion account just the amount of gas the company actually produces from its own wells. It is not the understanding of the management that that is all the gas that is going out from under that acreage. (Objection by Commission counsel overruled.)

We have made no correction or adjustment to take account of gas which may have been drained to or from the leaseholds of Texoma, so far as our book records are concerned. We have not known until recently any figure on that, and the expense of determining such a figure is quite a large sum of money. Since it did not affect the operations of Texoma, we did not see any necessity for correcting that figure. Whether there was provision made for the depletion or depreciation either, or however we handled our retirements, whatever was left after meeting the operating expenses from the operations of those companies belonged to the same people; namely, the stockholders, who also owned the bonds. Therefore, we have not in our bookkeeping dealing with those three matters, the retirement of acreage, depreciation and depletion, sought to conform our book figures to the actual physical conditions that obtained in the property of these two companies.

In Exhibit 141 and the revised sheet which has been marked Exhibit 210 depletion was taken into account in the cost of gas reserves less depletion, to January 1, 1939, and is reflected in line 21. The figure of $12,402,884 reflected in line 21, column 1, was determined by taking the aggregate cost of the companies' acreage to January 1, 1939 less any salvage that might have been obtained. I mean the cash salvage or property which we could utilize, and reducing that by the ratio between the reserves under that acreage as of August 1, 1931, as testified to by Mr. Dickinson, who brought in the figures on that point, prepared by Mr. Peterson. We used the reserves under those same leases as of January 1, 1939, as testified to by Mr. Peterson. That ratio, I believe, was 78.0374.

As near as it has been possible to do so through our Geological Department, we have ascertained the original reserves as of the time that we bought them underlying the leases which we owned on January 1, 1939, and have accounted for the actual depletion of those leases as determined by the quantity of gas remaining now under them. Had we used our book depletion only, the figure we would have gotten instead of $12,402,884 would have amounted to $14,740,659, or $2,337,775 more than that set up in Exhibits 141 and 210.

1921 *Cross-Examination by Mr. Booth.*

The book depreciation at the end of 1938 was $11,620,210. That is the figure you asked for in Exhibits 141 and 210. As I compute the book cost, after deducting the book reserve as of December 31, 1938, the plant account for property other than leaseholds or reserves would be $38,210,269. If that amount be added to the total gas reserves, less the depletion reserve, in the amount of $14,740,659, the sum of those two figures would be $52,950,928, instead of a total of $59,748,824 for the capital expenditures per books for the physical property, including gas reserves in line 19, less viewed depreciation and less depletion. Under your computation, the total would be about 62 million dollars, if the book depreciation and depletion had been deducted from the cost of the physical property plus the original cost of the gas reserves.

Redirect Examination Interposed by Mr. Morgan.

I have used in my Exhibits 141 and 142 and in Exhibits 210 and 211 the actual original cost less the actual depreciation and depletion instead of the book entries dealing with those subjects. That is the long and the short of it. I took the actual depreciation from other testimony. I took Mr. Biddison's testimony of viewed depreciation as the actual depreciation.

Cross-Examination by Mr. Booth Resumed.

I don't believe I am in a position to say that I have studied the report of the Special Committee on Depreciation which I read into the record this morning at Mr. Morgan's request sufficiently to express an opinion on it. Yes, one of the statements I read into the record bearing upon the sinking fund interest rate read as follows:

"Probably the nearest approach to a general rule is that the sinking fund interest rate might reasonably lie somewhere between the rate of bond interest on the low side and the rate of return on the high side."

The rate of interest on the bonds of Natural Gas Pipeline Company of America is 6 percent. I believe the rate of return which defendants claim they are entitled to in this proceeding is 8 percent. I cannot tell you what amortization allowance I would have arrived at in Exhibit 210 if I had computed the amortization allowance on a sinking fund method, had I used 8 percent instead of 2 percent interest, compounded semi-annually. I don't have with me a table which would show the figures for me. I did not bring that along.

We did not use a standard book or Moody's tables in computing the 2 percent interest compounded semi-annually computation. That was computed out in detail. I am not familiar with what the general practice in a matter of that sort is. I have never been concerned with the sinking fund procedure, and I can not answer what the general practice is. I know that such annuity tables exist. I know they are used in computing amortization. If I had such a table available to me, I could try to make the computation.

1922 (At this point the document described as mimeographed copies of Exhibit 209 which was received in evidence, as appeared on page 9725 of the transcript, were substituted for the original exhibit. A mimeographed copy was marked by the reporter, at the direction of the Examiner, as Exhibit 209 and was received in evidence, without objection.)

The computation stated in Exhibits 141 and 210, whereby in line 33 I arrived at the amortization allowance in the sum of $4,134,51, was made by one of my assistants and not by me. As I explained in my testimony concerning the exhibit, it was made under my supervision but I did not compute the figure. I could not state definitely just how he did proceed. I would use the regular amortization tables, and then check it. It would be necessary to check it, which he did.

You have handed me Financial Handbook, Second Edition, R. H. Montgomery, Editor. Beginning at page 1413 there are tables similar to those to which I have referred. I believe I could state approximately by the use of that table how I would arrive at the figure of $4,134,551, as shown in Exhibit 210. I think this table is on a semiannual basis. I don't know how long it will take me to make this computation. I am not familiar with this particular table. It is not the table I thought it was when I first looked at it.

Yes, you introduced an exhibit under Exhibit No. 187 by Mr. Kleinman which showed that defendants had paid a dividend of $1,500,000 during the first 8 months of 1939. The company has paid an additional dividend during 1939 in the amount of $1.45 per share, and I think that figures $2,175,000 or a total of $3,675,000 for the year. These dividends have been declared and paid.

Mr. Morgan: I have one other matter. Mr. Examiner, on December 12, 1939, we offered in evidence the contracts on file with the Federal Power Commission of all of the pipeline companies taking gas from the Panhandle field and conveying natural gas in interstate commerce, namely, the Colorado Interstate, the Cities Service, the Panhandle Eastern, the Northern Natural, the Lone Star and the Consolidated Gas Utilities Corporation, I believe the name is.

In that same connection, we offered the schedules and contracts referred to in paragraph numbered A of Order No. 53 of the Federal Power Commission, dated July 5, 1938, and the information requested in paragraph D of the same order which was filed with the Federal Power Commission by the same companies above named. That offer appears at about 9736 of the record and was a re-offer of the same contracts, although the other material was not offered before referred to in the transcript of another hearing and shown at page 5610. These contracts were offered and request was made that they be incorporated in the record by reference, since the contracts and the other material offered in connection with them are matters of record and found among the files of the Federal Power Commission.

We desire to renew the offer of those contracts and the other material offered in connection with them, and in this connection we wish to point out that the pipelines whose contracts are requested to be placed in evidence and the material taken from their reports to the Commission, which we desire to offer later, are pipelines which produce gas in the same field from which these defendants produce and transport their gas. The record shows that one of them transports gas to the city of Denver, and the Commission will, of course, take judicial notice of the distance between that field and the city of Denver.

The Cities Service transports gas from the same field and from other intervening fields to the city of Kansas City and to intervening points.

The Panhandle Eastern produces gas in the Panhandle, and also in an intervening field, namely, the Hugoton, and purchases gas in both of those fields, and transports it to a point at Dana, Indiana, and to intervening points.

The Northern Natural produces gas in the Panhandle, as this record shows, and from Hugoton and from Otis, another field in western Kansas, and transports that gas to Minneapolis, Minnesota, and to a number of cities along the way.

The Lone Star Gas Company, the record shows produces gas in the eastern part of that field and transports in the southeasterly direction across the southwest corner of Oklahoma to cities in northern Texas, including the city of Wichita Falls, the city of Ft. Worth, and the city of Dallas.

The Consolidated Gas Utilities Corporation produces gas in the eastern part of that field and transports that gas from that field and from other fields in western Oklahoma to points in western Oklahoma and southwest Kansas or southern Kansas, which is a comparatively short distance from the Panhandle field, as the Commission would see from the notice it would take of the geography.

We submit that when we have shown that these pipelines are producing gas from the same fields and transporting it, some of them over the same general territory, and others over territory that is not shown to be different in material respects from the territory over which we are transporting gas, and certainly such differences as there are, namely, that as between Amarillo and Denver, there are no large streams, and companies like the Northern and the Cities Service and the Consolidated and the Lone Star, none of them transport gas across the Mississippi River, and I think only one of them crosses the Missouri River,—that we have made a different showing, a prima facie showing of comparable conditions entitling us to place that information in this record and to make admissible the rates which they charge and the prices which they charge for the sale of natural gas at wholesale.

In this connection, we point out that three of the witnesses who testified for the two commissions, namely, Messrs. Knapp and Ostrander and I think Smith—I am not sure whether it was Smith or Kleinman, but one of those two—testified that in a rate investigation, it was useful to the one who was charged with the responsibility for the inquiry, to have the charges of the other companies that are rendering similar service for the sale of a similar commodity.

In the light of those facts, we offer this evidence and submit that if that evidence be received, it will show that although our pipeline is conveying gas more than 950 miles, it is selling gas of all classes for less than any of them with the exception of one or two classifications of gas which are sold at a slightly lower rate by the Consolidated, which is a very short line.

And we renew our offer of that testimony and urge that it be admitted in evidence.

(Stamp) Federal Power Commission Docketed Jan 20 1940 HTS Docket Section Secretary's Office 100-2 S-109 F.

Air Mail

Jan 20 1940.

S. A. L. Morgan, Esquire,
c/o Natural Gas Pipeline Co. of America,
20 North Wacker Drive,
Chicago, Illinois.

Dear Sir:

Pursuant to my telegram of today, this letter is addressed to your offer in evidence of the material referred to at pages 10390-4 of the transcript in the proceedings re F. P. C. Dockets G-109 and G-112. This offer embraces: "the contracts on file with the Federal Power Commission of all of the pipe line companies taking gas from the Panhandle field and conveying natural gas in interstate commerce, namely, the Colorado Interstate, the Cities Service, the Panhandle Eastern, the Northern Natural, the Lone Star, and the Consolidated Gas Utilities Corporation * * *" (T. 10390); that is, "the schedules and contracts referred to in paragraph numbered A of Order No. 53 of the Federal Power Commission, dated July 5, 1938, and the information requested in paragraph numbered D of the same order which was filed with the Federal Power Commission by the same companies * * *" (T. 10390-1).

Counsel immediately amended his offer (T. 10399) to include certain maps filed by the six companies pursuant to Subdivision 7 of Order 51. This offer, save for the amendment, is in substance the same as a previous one (T. 9736 also 5610) denied by the Examiner on grounds already stated in the record (T. 9890-2).

Counsel submits that if these pipe lines produce gas from the same fields and transport it over the same general territory or territory not shown to be different in material respects from the territory over which the two respondent companies are transporting gas, there is a sufficient or prima facie showing of comparable conditions to make admissible the rates which they charge for the sale of natural gas at wholesale (T. 10392-3).

Counsel has stated in connection with the pending offer that at least four of these six companies produce gas from fields other than the Amarillo field as well as from the latter field (T. 10391-2). A fact somewhat in contrariety to the substance and theory of counsel's previous statement pertaining to prima facie comparability.

The Rules of Practice and Regulations of the Federal Power Commission (under the Natural Gas Act) provide in Section 50.44, with respect to offers in evidence of matter contained in a report or other document on file with the Commission, that while such document need not be produced or marked for identification, nevertheless the provisions of the preceding Section (50.43) will apply. That preceding section requires that when relevant and material matter is offered in evidence by a party which is embraced in a document containing other matter not material or relevant, the relevant or material matter must be plainly designated, etc. Order No. 53 (paragraphs A and D) and Order No. 51 (Subdivision 7), require the filing of comprehensive rate and charge schedules and data, the monthly amounts of natural gas sold over a given twelve-month period with the charges therefor under each rate applicable, and the maps referred to by counsel.

The Examiner does not believe, having in view counsel's statement of the purpose for which such evidence was offered (T. 10393), that such an agglomerate offer complies with the requirements of the Commission's Rules (Sections 50.44, 50.43), above referred to. The Examiner, further, has taken the pains to ascertain the volume of material the six companies have filed and with respect to which counsel's offer apparently relates. The volume of this material is great and the offer must be deemed to conflict with the end that the Commission's rules referred to are designed to attain. Counsel's statement of purpose, that while the subject companies transport natural gas to a greater distance than any of the six companies its rates in all classes are less with few exceptions, does not present a practical formula by which the bulk of the matter offered can be reduced to feasible size. In short, counsel has not complied with the rules of the Commission applicable to an offer of such genre. But beyond this the Examiner is convinced the proposed offer is subject to the same objections mentioned in his ruling above referred to which denied a previous offer of such material. The Examiner, therefore, hereby denies the offer of counsel to incorporate by reference the schedules and contracts filed by the six companies pursuant to paragraph A of Order No. 53 and the information filed by those companies pursuant to paragraph D of the same order, as well as the maps filed pursuant to Subdivision 7 of Order No. 51.

The Examiner also denies the offer of counsel for the Federal Power Commission of his exhibit for identification No. 212.

A copy of this letter is being filed with the Secretary of the Federal Power Commission for docketing as a formal document in the proceedings in re F. P. C. Dockets Nos. G-109 and G-112.

Yours very truly,
/s/ Ewing G. Simpson,
Trial Examiner.

EGS/SG
1/19/40

cc—Commissioner Draper
Chief Examiner Hampton
Mr. Slaff
Mr. Booth
Secretary (3)
Files (2).

An exception is hereby given counsel for the two companies with respect to the ruling adverse to his offer; and to counsel for the two Commissions with respect to the ruling on Exhibit 212.

Ewing G. Simpson,
Trial Examiner.

1923 S. E. CAMPBELL, Recalled, Testified:

(January 10, 1940.)

Recross Examination by Mr. Booth.

Yes, Mr. Booth, I have completed my determination by the application of this table. I can make the same check for the 8 percent with these same figures and determine what the annual amortization allowance would be, approximately, on the basis of an 8 percent sinking fund interest rate rather than the 2 percent. That will be the approximate figure derived on the slide rule.

Applying the 8 percent interest to the sinking fund and compounding it semi-annually, I arrived at the annual amount to be set aside in 32 semi-annual payments, beginning June 30, 1939, of approximately, $2,470,000 as compared with the $4,134,000 on the 2 percent basis.

1924 ROBERT H. DELAFIELD, recalled for further cross-examination, testified:

(January 10, 1940.)

Recross Examination by Mr. Booth.

The figures beginning in line 14, at page 10,085 of the record, reading "$500,000" is obviously an error. It should be "$500,000,000." I have corrected my testimony, and while there are many minor mistakes that I won't point out, there are 6 or 8 that I might point out to you. It might affect your examination like the one I just referred to.

If you will look at page 10,106, the third line from the bottom, the third word is "of" not "off". The word "properties" should follow the word "producing", so that the expression would read "producing properties".

On page 10,123, line 16, the second word "not" should be stricken. I do agree.

On page 10,133, the last part of the long paragraph, there is one nought too many on each figure. It should read "Now, if you multiply that by a million, that is 6,000 MCF which at 50 cents is $3,000." The figure in line 14 should be "$3,000" and not "$30,000."

On page 10,145, the 14th line, the second word should be "peak" and not "big".

On page 10,147, the first line, the third word is "were".

In the line directly below that word, the word "piped" should be "heated".

I do not think it is important, but on page 10,078, line 14, the record shows a question by Mr. Booth: "What were they?" I have a very distinct memory that the question was by the Examiner, and was "What was the percent increase?"

At page 10,088, line 6, appears the statement, "and obviously a serial of 100 percent." That should read "a serial and 100 percent sinking fund issue."

At page 10,115 and the following page, I stated:

"Well, he is most concerned with the risks that are of daily occurrence in the business and constant to the business, but I should qualify that answer, of course, by saying that the first thing that an investor would look at would be the management today, to ascertain whether it was a good management. Bad management is the worst kind of a day-to-day risk."

You ask why an investor would be concerned with the character of management. The first consideration
1925 in an investment, Mr. Booth, is credit, whether you are buying an equity or making an investment in a loan. The first consideration of credit is character. And the character of a company is its management. To use a loan for an example, a dishonest management would not be a good credit risk to the lender. Yes, I assume that the management, with respect to most of the large companies and utilities in the country, is honest. That is my position. The reason I said that the first thing an investor would look at would be the management is because, if the management is bad, I should think that that would debar, on the part of the investor, investment in a good property.

Even if the management was honest, that would also be the situation if it was incompetent. That would be incompetent management. The management is the character of a business. It is the directing genius of the business, the spirit of the business. If you remove management in the broad sense of the term, there is nothing left but the bare bones or the shell. The management is competent to undertake the various problems from time to time, and in fact every day which affect ordinarily the profitableness and the success of the business. Whether or not that in turn very seriously affects the risk of the investor in the enterprise, my answer is yes, that is the risk of bad management, which I was eliminating here.

Yes, it is the relative skill and ability and competence of the management in facing day by day problems that seriously affect the successful character of the enterprise and affects the risk of the investor. And if the management is unusually competent and able, they are better able to decide day by day problems which confront the management in determining whether or not the enterprise and the business is going to be successful and thus affect the risk of the investor who has put his money in the enterprise.

It is perfectly obvious that the management of ordinary businesses, unregulated businesses, the steel business or the candy business, must undertake day to day problems and decide those problems properly in order that the business may be successful, and that directly affects the risk of the investor in an enterprise. We are talking in all of this about management.

From that standpoint, it is the problems that the management must face and decide day to day which determine the success of the enterprise and affects the risk of the investor in the business.

I may have made a rather broad statement at page 10,113, when I said "risk is a possible future event which may be adverse to a business," but the risk in a given business, assuming, as I stated at the top of page 10,116, a reasonably good management which is the first step always, is the risk inherent in that particular business itself.

Now, if I may exemplify. A good management in an airplane business will run it well. A good management in a gas business will run it well, and we can see that the risks in the two businesses arise from totally different things and are different. No, it is not true as between industries. No, as between industries, it is not the quality of the management as to whether or not it is competent, able and skillful in deciding the day by day problems which constantly confront it, which determine the sucess-
1926 ful character of the enterprise, and directly affects the risk of the investor in the business.

I will answer a little more broadly, Mr. Booth. The position I am taking here is that if you assume good management of a large group of industries, then you cease to consider the risk of management in comparing those industries. If you assume a bad management of a large group of industries, you do not need to consider the risk of management in comparing those industries.

Redirect Examination Interposed by Mr. Morgan.

That is because good management, as I have stated, in the airplane business will run a good airplane business if it is possible, and good management in the gas business will run a good gas business, but that does not change the comparability of the fundamental risks in those businesses, nor do the investors so consider.

If the investor had knowledge that a management was bad, it is obviously that you could not get a cent for the business anywhere. I might qualify that by saying, bad enough. I suppose there is a degree of badness that other attractions might overcome.

Recross Examination Resumed by Mr. Booth.

Yes, it is true that the investor might not know anything about the character of the management. It is possible that the management might be skillful enough to conceal its charaster from an investor.

Redirect Examination Interposed by Mr. Morgan.

The risk of management ordinarily obtains in no greater degree in one class of business than in another. There are some few very simple industries where less skillful management is obviously required, but ordinarily, no.

Recross Examination by Mr. Booth (Resumed).

You ask me to assume that some additional natural gas reserves were discovered in the State of Ohio, and the management of our company was confronted with the problem as to whether or not its business made it desirable to acquire part of this additional quantity of natural gas acreage in this new field, and to further assume that our company had an investigation made of its present reserves and prospects of business during the next few years and decided not to make that additional investment or the investment in the additional acreage. You also ask me to assume that a few years later the business of the company grew somewhat more than had been anticipated by the company, and it did not have enough natural gas reserves. You ask me to state whether or not the decision which the management made at that time directly affected the risk of the investors who had put their money in the business of our company.

I think that that illustrates my point perfectly, in that had it not been the natural gas business, no question of purchasing or not purchasing reserves, no question of the future supply of gas, would have arisen. The risk, to my way of thinking, arises from its being the natural gas 1927 business, and not from the management. Certainly, the question of whether or not the management decided on a certain day not to put any money into that additional acreage has a direct effect upon the risk of the investor; but if it were not in the natural gas business, they never would have to make that decision. Any management has to make comparable decisions, and, therefore, I eliminate the question of management in trying to compare the businesses.

No, I am not denying that the management of ordinary business is not confronted with day by day decisions in the conduct of that business which directly affect the profitableness of the business; but the same is true of the natural gas business.

Recross Examination Interposed by Mr. Slaff.

I have not said that there is no difference in degree between the natural gas business and any other business as to that element of risk. I could not say that. There is a difference in degree as to that risk among all businesses. It might be very hard to decide just what the degree was, but there is. I think there is a difference in degree between the natural gas business and unregulated industry as such.

You ask if it is my positions that the risk of the day to day decisions is greater in the natural gas industry than in unregulated industry, or less in the natural gas industry than in unregulated industry. In one type of decision it would be greater. In another type of decision it would be less. In the case of the natural gas business, if I may borrow Mr. Booth's example, it is a greater decision for a natural gas management to have to decide whether they will buy a huge inventory of a product, to go over an extended period of years, than it is for the flour miller to decide to buy an inventory of wheat which he hedges simultaneously. In that particular instance, the risk is in favor of the gas company. Now, as against that, if I may go on, it is less of a decision, perhaps, to decide whether or not they will buy $5,000 worth of pipe today than it is for the man in the chemical business to decide whether he will buy a newly invented retort.

Recross Examination by Mr. Booth (Resumed).

You ask me if, when this company decided in 1931 and 1932 to acquire certain acreage with which it intended to have an adequate supply to serve the City of Chicago and the territory that it contemplated serving for a period of 15 or 20 or 25 years, they made that decision, and therefore were not called upon to decide that problem again after they had a survey made of the gas acreage which was or was not profitable. I think you are wrong on that, Mr. Booth. The moment they made that decision, they had a continuing problem as to what they should do with that reserve acreage. In other words, they had to determine whether they should continue to carry reserve acreage by rentals and thus reduce their profits, or whether they should take on additional acreage to meet possible future demand which did not exist at the moment. That acreage from that time on is a constant problem.

It might be a little exaggeration as to a producing company to say that they had to make day by day decisions as to the handling of that acreage and that such day by day decisions affect the enterprise. It is a constant problem. Your acreage problem is a constant problem, and your reserve problem, of course is too. Acreage is an incident of the natural gas business.

1928 You ask if it is the decisions that the management is called upon to make which affect the profitableness of the enterprise and the risk of the investors in the business. We take a different position on that, Mr. Booth. I say that the fact that acreage is an incident to the gas business produces the necessity for decision. Yes, the decision of a bad management will ruin the company, but I always assume good management.

It is the act of the management in deciding the acreage problem one way or the other which is going to have an effect upon the profitableness of a business. It is true; but if it were not for the risks that are inherent in the natural gas business, that decision would never have to be made. The problem seems to me to be easier if you look back to the fundamental risks rather than to some in the intermediate stage. The risk in the gas business is the necessity of maintaining acreage, maintaining a balance between acreage and producing lands, being able to have enough reserves ahead, and being sure that you won't lose your gas. Those are problems inherent in the natural gas business. I don't know how much additional acreage this company has acquired since 1930. I may have known, but I don't remember.

(At this point the witness was excused to permit S. E. Campbell to conclude his testimony. Thereupon, Robert H. Delafield resumed the stand and his cross examination was continued by Mr. Booth.)

No, I do not know approximately how many strikes there are in the utility business generally in the course of a year. I can remember the strike on the Consumers Power Company at the Thornapple plant which shut that down. We had a strike during the same year in our gas plant in Toledo. During the same year, we had a threatened strike and were under guard in the State of Kentucky. Those were all within a one-year period, which year I should say was 1934. We had one strike and walk-out that same year in a compressor station of the Manufacturers Light & Heat Company, which shut the station down. I am not quite certain that that was 1934, but it was all within that same period.

In the number of disturbances, the ones I have mentioned are much less than those in the automobile industry. I should say that in the utility industry, generally speaking, there are fewer strikes than in the automhile industry. I said in the number of strikes. In the same one-year period I previously mentioned, we had a strike in an electric generating station in Dayton. They come to your mind pretty fact when you try to remember them. I could not answer as to the number of labor disturbances that did not result in strikes. Prior to that period, we were very disturbed because of the character of labor in our experience in the gas business in the Appalachian region, and we had a very hard time.

I think it is true that, generally speaking, the labor problems are much more serious in character in unregulated businesses like the automobile business and the steel business, than in the utility business.

I take issue, Mr. Booth, with your word "regulated." I do not think it is the regulation that reduces the number of strikes in the utility business. That has nothing to do with it. I think it is true as I have said that labor strikes
and labor disturbances over the history of the utility
1929 business are relatively less than the labor problems
in unregulated businesses like the automobile busi-

ness and the steel business, but I could not prove it. I said that is true. May I supplement my answer, Mr. Booth, by remaking the point that the seriousness of a labor disturbance or strike is not always in its frequency or the number of men involved. That is especially true of the difficulty we have with labor in our business.

Recross Examination Interposed by Mr. Slaff.

It is the difference in the character of the business between so-called regulated and unregulated businesses which account to a large extent for the difference in the number of strikes and labor disturbances, in that the regulated industries are those normally in which the public at large is considered to have a large stake in the regular maintenance of service as contrasted with unregulated industries. That is the greatest deterrent to strikes in the business.

It might be true that another great deterrent to strikes in the utility industries is that the wage levels are generally pretty high, higher than in business normally. I am not at all sure that it is true. It might be true. It is not necessarily true that employment is more regular in the natural gas business, on account of the large amount of casual labor which you use.

Recross Examination by Mr. Booth (Resumed).

You ask concerning a credit loss suffered by Natural Gas Pipeline Company of America as a result of rate reduction. It is my impression that there never had been any determination by regulation of that rate, but it is also my impression that when this line was built and went into the business of supplying Chicago with natural gas, that the question of regulating the rate at the city gates was not up. It is my impression that this company at that time was free of regulation. I may be wrong in that. The controversy arose over the efforts of the State of Illinois to pass upon the reasonableness of the price paid by the Peoples Gas Light & Coke Company to Chicago District Pipeline Company.

You ask if it isn't a fact that the loss of money did not arise from what is known as an ordinary credit loss, but arose from the fact that the State of Illinois was endeavoring to determine what constituted a reasonable price for natural gas. Well, a credit loss arises because the debtor has not the money to pay, and this debtor did not have the money to pay and a loss resulted. I do not seek beyond the fact that the debtor did not have the money to pay.

No, I don't think there would have been any question about the Peoples Gas Light & Coke Company's and the Chicago District Pipeline Company's ability to pay the contract price if the State of Illinois had found the price fixed in the contract to be fair and reasonable.

At page 10,105, beginning with line 13, I testified: "In other words, when a company goes and buys new acreage, they must do it with their own money. They cannot borrow money for that purpose." That means they cannot borrow money for that purpose. Al I meant by that statement was with that restriction in the mortgage indenture, the company could not borrow money for that purpose under that issue.

1930 At page 10,095, line 2, I testified: "In addition to which, the enormous increase in the use of natural gas, if anything, adds to the risk of depetion and exhaustion." The problem of depletion is not substantially taken care of if adequate allowance is made for depletion and depreciation. If you figure on creating a depletion reserve over a 14 year life of a field, and the life is only 10 years, and that gas is all gone, you are just as short in your depletion reserve as if—

You ask if provision for depletion is made on a unit basis, the amount of natural gas that is withdrawn or sold, then the problem of depletion is substantially taken care of. No, because it is not a problem within the control of this company that I had in mind. A great many companies are operating in this field, and they are taking out a great deal of gas. All of the reserves and all of the amortization is figured on a basis that so much will be taken out, and the increased use of gas increases the risk that the life of the field will be shortened, in which case your depletion or your amortization period will not be completed before exhaustion.

The amount of depletion is not determined on a basis of so much for each thousand cubic feet of natural gas that is taken out of the field. Each company operating in a field takes gas out of it. This company figures that it will take out so many million feet, and that the other companies will take out so many million feet, and based on an estimate of the life of the property, they fix a unit amount per unit taken out. Now, the other company comes along, say there are only two in that field, and it takes out ten times as much gas as this company thought the other was going to take out, and the exhaustion of the field is therefore much quicker, and this company may have taken out exactly the number of units that it thought it was going to take out and charged exactly the depletion charge to each individual unit, and it would still have lost out.

One company does not charge for each thousand cubic feet of natural gas withdrawn by the other people in the field; only for the thousand cubic feet withdrawn by them. You ask whether or not if all the natural gas is withdrawn by some or all of the companies, and if they all charge on a unit basis according to the amount of natural gas that is in fact withdrawn by them, then do they take care of the depletion of the entire field. They take care of the depletion of the entire field, but the first company I mentioned here gets approximately one-tenth of its depletion reserve, and the second company ten times its depletion reserve.

If the first company loses some of its natural gas, it is of course possible that it is taking natural gas from some other company. I am not saying that it is true in this case. I am simply giving an example. That would not be true if there were just two of these people. The example I used assumed that there were two of these people, and number 2 gets out part of what number 1 was going to take, because he took out 10 times as much as was contemplated. In that case, number 1 would not be compensated for what he lost to number 2.

You ask how the normal temperatures to which I referred are arrived at. We use four or five principal cities in our territory where there are United States Weather Bureaus and where weather records exist back until I think 1852. We consider as normal for that general territory the temperatures as shown for those cities. At this moment I am sorry I do not know whether I used the average or the mean. I have the table here which I will be glad to give you. The figures I read yesterday are the monthly devia-
tion from normal, the month being from the 15th to
1931 the 15th, corresponding to the billing month, and are
the composite figures for the cities of Cincinnati,
Pittsburgh, and Toledo. Normal is an average for a period

which I think goes back to 1852 on down to the present. It has changed, as I remember it, not at all in that time. It may change from year to year, but over a period, the normal temperature has not changed as much as one degree.

Recross Examination by Mr. Slaff.

At the end of 1938 there were 12,304,282 shares of Columbia common stock outstanding. There has been no appreciable change since then. I don't know what Columbia common stock is selling at today. It closed last night at 6¾. It has been selling around 6 for the last week or two. It rose to a high of either 7⅛ or 7¼ on Monday, and has since gone off to 6¾.

947,845 shares of 6 per cent preferred, $100 par value, are outstanding in our company. We also have a $5 preferred, or rather a 5 per cent preferred. There are 40,466 shares of this 5 per cent preferred stock outstanding. The par value is $100 per share. My recollection is that the 5 per cent last sold at about 70. It is very inactive. I do not believe it sold yesterday. The bid and asked was 76 and 78, I think.

The 6 per cent preferred is selling at about 10 per cent off. That sold yesterday as I remember it at 90¾. That stock has risen quite rapidly in the last two weeks.

We have three outstanding bond issues, all bearing 5 per cent; a very small issue is due in 1952; a $50,000,000 issue is due in the same year; and a $50,000,000 issue is due in 1961. I think both large issues are selling at a premium. At present they are selling at from 104 to 104½.

There is one other issue of preferred stock there. We have 123,600 shares of 5 per cent, $100 par value, preferred stock listed on the New York Curb, and the last sale I saw I think was 65.

Question by the Examiner.

That is the complete financial structure of Columbia.

Redirect Examination by Mr. Morgan.

That 5 per cent preferred which I first mentioned is selling at about 70. That is a $100 share. It is a different series of the same issue as the 6 per cent preferred. The stock which sold at 6¾ yesterday is a no par value stock with a stated value on the books of $1, and a book value due to the capitalization of the company under orders from the Securities and Exchange Commission of approximately $14. I do not have that exact figure. It is selling at a little less than 50 cents on the dollar.

Recross Examination by Mr. Slaff.

During my direct testimony, I mentioned Godfrey Cabot
and that organization. You ask if they had operated carbon
black plants in the eastern fields. They used to, Mr.
1932 Slaff, operate carbon black plants in West Virginia,
and I think in eastern Kentucky. I am not so sure of
the latter; but to the best of my knowledge, they have not
operated any carbon black plants in the Appalachian fields
for some years.

I am under the impression that their ceasing to manufacture carbon black in the east was due to the law, though I am not sure that the manufacture of carbon black in West Virginia is prohibited by law. I am not sure that it is in Kentucky. The price of gas in the fields in that section of the Appalachian area, to the best of my knowledge, has not changed a great deal in the last 15 years. It has changed a great deal in the last 30 years, but not going back to 1926 and 1927.

Redirect Examination by Mr. Morgan.

Yes, I have run into some strikes among regulated concerns in my travelling around, like taxi companies, street railways and railroads, and companies of that kind. I am speaking over a period and not just at this particular time.

Cross-Examination Interposed by Mr. Slaff.

No, I did not happen to see the report of the Railway Mediation Board the other day that there were no strikes under its jurisdiction except one short airplane walk-out of the ground crews during this past year.

Mr. Booth asked me about the risk involved in the day to day decisions. Those are not the kind of risks that I have taken into account in arriving at a proper rate of return, the risk that management might make a bad decision because of incompetence or deliberately do it because of a lack of character.

The risk that I have considered is the risk that however competent the management and however wise the decision may seem to be at the time the management makes it, that because of the character of the business and the circumstances that surround the business, it may turn out to be a bad decision. A decision to invest $15,000,000 in a gas reserve would subject the company whose money the decision affected to as much danger of loss as would 15,000 decisions involving $1,000 each.

I never heard of a regulated concern applying to a regulatory body for an increased rate of return, as compensation for risk because of the danger that the management might turn out to be bad or incompetent. (Objection by Commission Counsel overruled.)

1933 JOHN A. COOKE, a witness for defendants recalled for further cross examination, testified:

(January 10, 1940.)

Recross Examination by Mr. Booth.

You have asked me to read into the record the definition of depreciation appearing at page 2 of the Federal Power Commission Uniform System of Accounts for Natural Gas Companies. The definition appearing on that page under No. 14 reads:

"Depreciation as applied to depreciable gas plant means the loss in service value not restored by current maintenance incurred in connection with the consumption or prospective retirement of gas plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and requirements of public authorities, and in the case of natural gas companies, the exhaustion of the natural resources."

You ask if in determining the amount of depreciation which should be set up for this company, if I was auditing its books, would I be guided by that definition of depreciation. At the present time no, but if it were under a regulatory commission and the accounts were under regulation, we would have to be guided in determining the company's action by the instructions contained here if they have not been upset for some reason or other by law. It is a question of the manner of keeping the accounts. If these are the regulations, then the company must comply with them for its books.

No, I do not know that this company is now subject to the jurisdiction of the Federal Power Commission. I have not seen the classification of accounts applying to these companies, which you say the Federal Power Commission has recently promulgated. I will take your word for it that it has been issued in the last few weeks. I don't know. If that were true, then that definition of depreciation would be followed for accounting purposes, in accordance with the Commission's requirements.

Redirect Examination by Mr. Morgan.

When I said it would be followed if the company was under the regulations, I meant the accounting regulations. The regulations pertaining to the company in question, meaning that that would be applied under those regulations of the Commission as being the proceedings and accountings which they must follow.

No, I do not know that there is a motion for rehearing pending before the Commission going to those accounting rules. I think I covered that possibility when I said that "unless it was upset" it would apply as it was written—unless it was upset by legal proceedings.

Recross Examination by Mr. Slaff.

1934 No, I am not familiar with definitions of depreciation as they occur in other systems of accounts, such as the Federal Power Commission System for Licensees and Public Utilities, the Federal Communications Commission and similar systems.

I do not keep the books, but check them to see that the company has carried out the generally accepted principles of accounting. When I certify a balance sheet or an income statement, I attempt to have that reflect as accurately as I can the actual financial facts of the company within the observed or accepted limits. I have to say that, because there are certain things in there which by reason of our limitations we can not cover.

1935 W. C. GILMAN, a witness for defendants, recalled for further cross-examination, testified:

(January 10, 1940.)

Recross Examination by Mr. Booth.

Yes, I have repeatedly referred in my testimony to the fact that the securities of natural gas pipeline companies provide for the retirement through the sinking fund method and are of rather short terms. I have characterized the sinking fund requirements as of a heavy character. I am not implying that that feature was disadvantageous to the company which was issuing the securities and made it difficult for it to sell the securities. As a matter of fact, it makes it easier for them to sell the securities and makes the securities more attractive to investors,—a particular type of investor.

That is a specific characteristic which gives them their peculiar attractiveness at this time. Institutions, like insurance companies, which have a continual or almost continual inflow of funds from their policy holders, must put their money at work to earn a return. In times of low interest rates as we are in now, where bonds are sold with a 3¼, 3½ or 3¾ per cent coupon, the investing officials of insurance companies, through past experience, are generally of the opinion that we will pass through this phase of very low money rates, and maybe in 5 or 8 years get back to a period where they will again be able to get good first mortgage bonds on a 5 per cent basis. Therefore, they are naturally anxious not to tie up their funds any longer than possible in these low coupon bonds, and a natural gas pipeline issue that has a total maturity of 15 years, with 100 per cent payout, has an average maturity of only 7½ years, so they have got their money to work at a rate low admittedly, but in 7½ years they will have half of their money back, and perhaps at that time they can be putting it into 4, 4½ per cent or 5 per cent securities.

The issuing company at this time has its choice of either a public offering or a private sale to institutions. Just thinking quickly here, I would say that probably in the last five years there have been more of those bonds in volume placed with institutions at private sales than sold through public offerings. Even in the case of public offerings, institutions of the character that I have referred to are frequently very large buyers of this class of securities.

Redirect Examination by Mr. Morgan.

In my replies to the last few questions by Mr. Booth, I have been talking about bonds. The whole discussion has been on bonds.

You ask what the fact that these attractive features have been added to the bonds of the natural gas business has done to the risks, so far as the equity holder is concerned. The equity holder, the person who buys the common stock of any company, owns the company, and he essentially carries the risk of the enterprise. If he wishes to borrow money from a lender and meets the lender's terms and promises to pay the money back well in advance, or substantially in advance, of the estimated life of the supply, in the case of natural gas companies, the buyer of the bond is, to that extent, shifting the risk to the equity holder, or at least keeping the risk with the equity holder.

1936 You ask what the effect of that has been on the issuance of original equity securities or the refinancing of equity securities. In recent years, there have been practically no offerings to the public of equity securities of pipeline companies.

There are always continuous tradings of the common stocks of pipeline companies whose securities are listed on the Exchanges; but that does not bring out any new securities.

Natural Gas Reserves
Texas Panhandle

Pressure Base Used—16.4 Lbs.
C. J. Peterson—Witness.

Total original recoverable reserves of the Panhandle field at the following assumed wellhead abandonment pressures:

(a)	0 lbs.	16,955,758,431	MCF
(b)	25 "	15,991,092,936	"
(c)	50 "	14,989,327,612	"
(d)	75 "	13,987,579,763	"
(e)	100 "	13,022,914,269	"

Recoverable reserves of the Panhandle field as of January 1, 1939, at the following assumed wellhead abandonment pressures:

(a)	0 lbs.	9,799,519,611	MCF
(b)	25 "	8,834,854,116	"
(c)	50 "	7,833,088,792	"
(d)	75 "	6,831,340,943	"
(e)	100 "	5,866,675,449	"

Total original recoverable reserves underlying the acreage owned by Texoma Natural Gas Company on January 1, 1939, at the following assumed wellhead abandonment pressures:

(a)	0 lbs.	2,744,518,086	MCF
(b)	25 "	2,588,373,970	"
(c)	50 "	2,426,224,748	"
(d)	75 "	2,264,078,354	"
(e)	100 "	2,107,934,239	"

Recoverable reserves underlying the acreage owned by Texoma Natural Gas Company on January 1, 1939, as of the latter date at the following assumed wellhead abandonment pressures:

(a)	0 lbs.	1,989,662,119	MCF
(b)	25 "	1,833,518,003	"
(c)	50 "	1,671,368,781	"
(d)	75 "	1,509,222,387	"
(e)	100 "	1,353,078,272	"

1988 Tabulation showing the gas that has gone out of the formations underlying Texoma Natural Gas Company's acreage owned on January 1, 1939, including gas produced from its wells and that drained to other wells, broken down so as to show the production from Texoma Natural Gas Company's wells and the drainage to other wells or areas separately:

Original recoverable reserves 0 lbs.	2,744,518,086	MCF
Recoverable reserves (January 1, 1939) 0 lbs.	1,989,662,119	"
Total loss to Texoma Natural Gas Company's reserves	754,855,967	"
Gas produced from Texoma Natural Gas Company's wells	284,852,785	"
Gas drained from Texoma Natural Gas Company's property	470,003,182	"

$$\text{Percent lost by drainage } \frac{470{,}003{,}182}{754{,}855{,}967} = 62.26\%$$

1989

1993 EXHIBIT NO. 43.

Explanation of Reserve Calculations.

C. J. Peterson, Witness.

This estimate is based on personal experience and continual study of the conditions in the Texas Panhandle field. My study in the field commenced prior to 1926, but my time has been devoted entirely to a study of this field during the past eight years. Actual experience in the field has been supplemented by reference to publications on the field by the American Institute of Mining & Metallurgical Engineers, the American Association of Petroleum Geologists, the United States Bureau of Mines, and the Texas Railroad Commission. I have also been in continual touch with the other geologists working in the field. All of these factors have entered into my interpretation of structural conditions and analysis of the gas productivity of the field which is the basis for this estimate.

In working out details in the field, elevations used are furnished by Laughlin & Simmons, of Tulsa, Oklahoma, who are engaged in running elevations of wells in the Mid-Continent area and Texas. Detailed log information is obtained from the records of the Texas Railroad Commission, the files of the various operating oil and gas companies in the field, the reports of log records collected by the oil and gas company scouts in the field, and from a local well log service, which has access to the information obtained by the oil and gas company scouts. I have a large collection of logs, including all available logs on the gas wells in the field and a considerable portion of the oil wells drilled in the field. I continually keep in touch with the details of the formations encountered in the wells by microscopic examinations of well cuttings which I am continually collecting. In this connection, over 12,830 samples have been examined and I have on file over 60,000 samples.

In calculating the reserves of the Texas Panhandle field, I have divided the field into two areas. The area colored yellow on Exhibit No. 20 contains 1,033,970 acres of gas lands, which I consider the best commercial gas area of the field. The remaining area is shown in gray on Exhibit No. 20 and contains 432,967 acres of gas lands, and I term this area the marginal gas area.

I determined the average porosity and the average pay thickness for the area designated in yellow and applied the porosity thickness method to determine the reserves in this area. To illustrate: after much laborious effort, to which I have already testified, I determined the average thickness of pay for this area to be 70 feet, and the average porosity to be 20%.

In determining the thickness of pay for the yellow colored area, which is the area of best commercial gas production, the yellow area was divided up into fifteen separate divisions and the thickness of the pay determined as shown in the logs of 627 wells and the weighted thickness of pay obtained per acre. In figuring absolute reservoir pressures, the method used by the United States Bureau of Mines in determining the pressure exerted by the column of gas in the well was employed. In determining the average depth of the gas column in the Panhandle field, the weighted average per acre of the depth of the wells to the middle of the pay was determined. This weighted average depth was 2618 feet. These factors having been
1994 determined, the following controls were used in making my estimate:

Recovery factor 90%
Porosity factor 20%
Thickness of pay 70 feet

Reservoir pressure 471# per sq. in. absolute
Sq. ft. per acre 43,560
Total voids equals 43560 x 70 ft. x 20% = 609,840 cu. ft. per acre

Expressed in cubic feet at an absolute pressure of 16.4#, we have 471 divided by 16.4 x 609,840 cu. ft. = 17,514,000 cu. ft. per acre.

Total number of acres 1,033,970
Total indicated reserves in area = 17,514,000 x 1,033,970 = 18,108,950,580 MCF

In calculating the reserves in the marginal area colored gray in Exhibit No. 20, I found that this area was distributed widely and that the information available for control was not satisfactory to permit the averaging of this area in with the best commercial gas acreage or to permit the calculations of the reserves under this area by treating the area in total. Consequently, I first divided the 432,967 acres in the gray area into fourteen separate areas. I then made a study of all the available information in regard to each of these areas. This information consisted of any dry holes that had been drilled outside the boundary of the field and adjacent to the particular sector of the gray area that I was studying; all wells, whether dry or producing, that had been drilled in the sector; any wells that had been drilled in the yellow area adjacent to the sector, and the general location of this particular sector on the geological structure. Taking all of this information into account, plus anything I had learned or observed in my many years in the field, I arrived at my estimate of the average thickness of pay and the average porosity for each sector. I then calculated the original reserves of each of these areas by the thickness-porosity method which I have already illustrated and which I applied to the acreage colored yellow on Exhibit No. 20. I then added the calculated reserves of each of these sectors together to determine the reserves of the total area colored in gray. This reserve quantity, when added to the quantity determined for the yellow area, gives the total indicated reserves for the entire field.

I further illustrate the various steps in my method as far as the gray area is concerned by making reference to the attached table, which pertains only to the gray area and sets out the number of sectors into which I divided the gray area, the number of acres in each sector, the average thickness of pay in each sector, the average porosity in each sector, the average per acre reserve of each sector and the total reserves of each sector. The sum of the reserves of all of these sectors is an indicated reserve of 1,307,928,318 MCF. The indicated reserve for the gray area added to the indicated reserve for the yellow area gives a total of 19,416,878,898 MCF.

1995 To determine the original recoverable reserves for the entire field at any given abandonment pressure, I illustrate my method by showing the calculations for a wellhead abandonment pressure of 0#. Atmospheric pressure in the Texas Panhandle for the purpose of these calculations is considered to be 13# per square inch absolute. The weight of a column of gas for the average depth of well, namely 2618 feet, is 1 pound at 0# wellhead gauge. Therefore, the reservoir pressure at 0# wellhead gauge would be 13 + 1 = 14# absolute reservoir pressure.

The absolute pressure of 471# was obtained in the same way as the above pressure at 0# wellhead gauge was obtained, except that the wellhead gauge pressure, which was the original rock pressure in the Panhandle field, was 430# gauge. Adding to this atmospheric pressure of 13# and the weight of a column of gas 2618 feet deep at a wellhead pressure of 430 lbs., which amounts to 28 lbs., the total of 471 lbs. absolute reservoir pressure is obtained.

Since the absolute reservoir pressure of the reservoir is 471# and at an abandonment pressure of 0# wellhead gauge the reservoir pressure would be 14#, the amount of pressure in pounds per square inch used to leave a pressure of 14 pounds in the reservoir would be 471 pounds minus 14 pounds, which is 457 pounds. Thus the proportion of gas or gas reserves which could be expected at an abandonment pressure of 0# wellhead gauge would be 457/471, or .970276 of the amount of gas in the reservoir represented by 471# pressure, which, expressed in another way, is the amount of gas present in the reservoir at 0# absolute.

As noted above the total reserve of the field at 0# absolute was 19,416,878,898 MCF. Applying the factor .970276 gives a reserve of 18,839,731,590 MCF. Applying a recovery factor of 90% makes the reserve at the abandonment pressure mentioned amount to 16,955,758,431 MCF. This last amount represents the total original recoverable reserves of the Panhandle field at an assumed wellhead abandonment pressure of 0# gauge at the wellhead. I make similar calculations for any other wellhead abandonment pressure, making the necessary corrections.

In obtaining recoverable reserves of the Panhandle field as of January 1, 1939, at any assumed wellhead abandonment pressure, the total cumulative withdrawals for the field as of January 1, 1939, are subtracted from the total original recoverable reserves previously estimated for the several abandonment pressures. For example, the remaining reserve as of January 1, 1939, to an average wellhead abandonment pressure of 0# per square inch gauge was estimated by subtracting from 16,955,758,431 MCF, the estimated original recoverable reserve, an amount of 7,156,238,820 MCF, being the estimated accumulated total withdrawal of gas from the field up to this date. This figure is shown on Exhibit No. 25 entitled "Gas Produced From Texas Panhandle Field," which exhibit lists the authority for the various items entering into this total.

In calculating the reserves underlying the acreage owned by Texoma Natural Gas Company on January 1, 1939, I followed exactly the same method, namely, the porosity-thickness method, as I followed when I calculated the reserves in the yellow area, except that I did not apply
1996 the same factors for thickness and porosity. I had
very definite and specific information available regarding Texoma's acreage, and I divided this acreage into a large number of individual tracts and considered with each of these tracts all the information available in regard to thickness of pay and porosity. Having determined the thickness of pay and porosity of each tract, I then calculated the reserves of each of these tracts individually. In making this estimate Texoma's acreage was divided into approximately 506 tracts. The total reserve for Texoma's acreage was then determined by adding up the reserves figured for all these tracts. In this manner was determined the total original recoverable reserves underlying the acreage owned by Texoma Natural Gas Company as of January 1, 1939. As in the case of the yellow acreage mentioned above, a 90% recovery factor was applied to the reserves just mentioned. It will be noted on Exhibit No. 28 that the total original recoverable reserves underlying the acreage owned by Texoma Natural Gas Company on January 1, 1939, to an assumed wellhead abandonment pressure of 0# gauge was 2,744,518,086 MCF. At the time that these original recoverable reserves were figured there was also determined the amount of gas which would remain in the reservoir at the assumed wellhead abandonment pressures designated and with a 90% recovery factor applied.

In figuring the recoverable reserves underlying the acreage owned by Texoma Natural Gas Company on January 1, 1939, as of the latter date, at the assumed wellhead abandonment pressures designated on Exhibit No. 28, the actual absolute reservoir rock pressure was determined as of January 1, 1939, and the proportion of this absolute rock pressure, to the original 471# rock pressure applied to the original reserves underlying each tract as of January 1, 1939. Then the reserves determined for all the tracts were totaled and from this amount was subtracted the amount of gas which would be left in the reservoir at the designated pressures with a 90% recovery factor. This process resulted in the amounts noted in Exhibit No. 28 at the various designated wellhead abandonment pressures, and it will be noted that this reserve at an assumed wellhead abandonment pressure of 0# gauge was 1,989,662,119 MCF.

Referring to page 2 of Exhibit No. 28, it will be noted that the original recoverable reserves at 0# wellhead abandonment pressure gauge was 2,744,518,086 MCF, as shown on page 1, and that the recoverable reserves January 1, 1939, to the same assumed wellhead abandonment pressure, as shown on page 1, was 1,989,662,119 MCF. Subtracting the last amount from the first amount gives a loss to Texoma Natural Gas Company's reserves of 754,855;967 MCF. Subtracting from this amount the total gas produced from Texoma's wells, which includes the gas produced from Texoma's wells which have been bought by the company prior to their acquirement by Texoma and subsequent to this acquirement, which amounts to 284,852,785 MCF, the gas drained from Texoma Natural Gas Company's property amounts to the difference between 754,855,967 MCF and 284,852,785 MCF, which is 470,003,182 MCF. It must be noted that this latter amount includes the amount of gas which was wasted to the air during the drilling of Texoma Natural Gas Company's wells. Using this amount as shown in Exhibit No. 28, the total percent lost by drainage would be 62.26%. Allowing for the gas wasted to the air in the drilling of Texoma's wells, the percent actually lost by drainage would be approximately 61.26%.

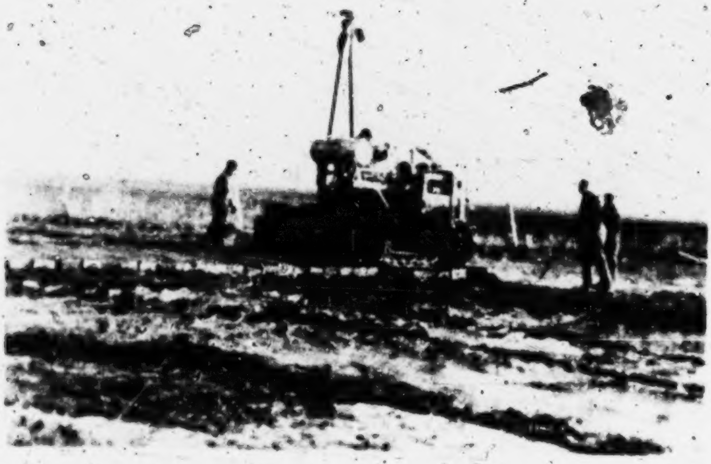
EXHIBIT NO. 85.

Photographs of Scenes
at Pipeline Break
Near Sheffield, Illinois

February, 1938

2.

Caterpillar tractor mired. Soil resembled peat.

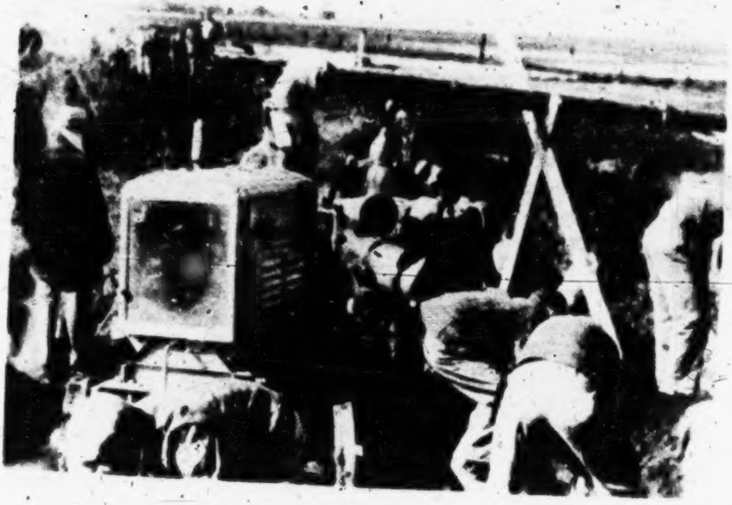


4.

Scene of line failure. Crater formed by release of gas when line failed. Main line gates have been closed each side of failure. Small amount of gas leaving line when picture was taken.

6.

Another view of the large crater.



8.

Line has been cut.
Moving in short joint
to make repair.

10.

General view of repair crew and sacked material used to weight the line after repair.

Exhibit 86

Consulting Engineer
Sixty Wall Tower
New York, N. Y.

August 15, 1939.

Mr. F. C. Brown, Vice President and General Manager
Natural Gas Pipeline Company of America
Chicago, Illinois

Dear Sir:

In accordance with your request, I submit a valuation of the property of Natural Gas Pipeline Company of America and its associate, Texoma Natural Gas Company. This valuation has been made on the basis of the cost to reproduce the property of the two companies as of June 1, 1939.

The valuation includes all physical property owned and used by the companies, with the exception of Gas Leaseholds, which item of property we were instructed to exclude from our consideration. The values which we have found are entirely physical, no allowance having been made for any item of an intangible nature.

As a preliminary step in making this valuation, a careful and complete detailed inventory was made of the entire property. Access was had to all map records, plans, detailed drawings, specifications, purchase commitments, well logs, job orders, and other detailed information in the files of the companies and permanently maintained by them. This data was checked against actual quantities in the field and was consistently found to be in close conformity with the property as it actually existed. The few differences found were easily reconciled and we are certain that the property as indicated in the detailed portion of this report accurately reflects the property as it physically existed on the date of valuation. Construction work in progress has been excluded from the inventory and the valuation therefore reflects only the property which had been fully completed and placed in service prior to June 1, 1939 and the cost of which was reflected by closed job orders on that date.

During the course of our work, we made no attempt to check titles to property, but accepted representations made by employees of the company as constituting proof of ownership. This applies particularly to such items of property as fee land and rights of way. Our engineers have not attempted to place values on the various parcels of land owned in fee, but have employed reliable local realtors to value these parcels. We have incorporated in the valuation the amounts which these realtors have reported to us as fairly representing the value of fee lands.

In the case of Rights of Way, we made a careful analysis and inventory of all easement and damage contracts, together with a detailed analysis of the cost of acquisition. We have then adjusted these costs to reflect conditions existing on June 1, 1939. To assist us in this work, we employed the services of an experienced rights of way agent who spent several weeks traveling over the route of the pipelines, interviewing land-owners, realtors, county agricultural agents, and other parties having a knowledge of existing values. The unit prices which we have used with respect to rights of way have been predicated to a considerable extent on data obtained from this actual field study.

2156 Unit prices have been compiled and applied to the assembled inventory which reflect prices of materials and labor rates prevailing in the immediate territory as of the valuation date. In computing these unit prices, we have been guided by the manner in which the project was originally constructed, and have considered that in the reproduction of the property the same general plan of procedure probably would be followed. This contemplates that about the same length of time would be necessary for the design and construction, that the same general type and number of construction contracts would be let, and we have assumed as a matter of course that the most modern and economical methods of construction would be employed. It is further contemplated that the same type of materials would be used as were used in the original construction of the system.

Prices of materials and equipment were secured from actual quotations by dealers and manufacturers of these identical items. Requests for quotations specified the required quantities so that the prices used would reflect any savings due to quantity purchases. Labor rates were obtained from contractors and builders operating in the immediate territory and were predicated on wage levels as of June 1, 1939, with due consideration given to prevailing union wage scales. Freight rates were obtained from railroad traffic bureaus and insurance and tax rates predicated on existing local conditions.

Due to the great variance of labor rates and material prices at different points of the system, it has been necessary to compile individual unit prices for each compressor station and for each state traversed by the pipeline system. Through extensive analysis, average unit prices could have been evolved which would apply to the system as a whole, but the application of such prices to a particular portion of the system would have produced distorted results. The method which has been followed produces greater accuracy and gives a true value of each individual portion of the system.

In valuing the gas wells, the assumption has been made that a drilling program would be inaugurated coincident with beginning of construction of the main pipeline system, and that the program followed would provide for all of the wells being drilled between this time and the time of completion of the main pipeline system. This drilling program thus contemplates that a minimum amount of drilling tools and equipment would be employed and that the first wells drilled in a particular area would provide fuel for the drilling of subsequent wells.

It will be noted that in arriving at the Present Value of the different items of property, a deduction for depreciation has been made from the Reproduction Cost New. This depreciation deduction was determined by Mr. P. McDonald Biddison, Consulting Engineer, Dallas, Texas, who was employed by the companies to make a study of existing depreciation of property and report upon this specific item. We have taken the findings of Mr. Biddison and have deducted from the Reproduction Cost New the amounts determined by him as representing existing depreciation of property. As a consequence, the amounts shown as Present Value are a composite of our determinations of Reproduction Cost New and Mr. Biddison's determination of existing property depreciation.

The ensuing pages of the report show in detail the amounts included for General Overheads, both of a structural and corporate nature. In arriving at the amounts so included, we have been guided by the actual experience of the companies during the construction period. A care-

ful analysis of all overhead construction expenditures
2157 was made and this analysis adjusted to reflect conditions prevailing as of the date of valuation, formed the basis of our calculations.

Organization Expenses have been calculated with due regard to present existing laws, and costs incurred by virtue of such laws. Taxes during Construction have been computed on the basis of present assessments and rates with the necessary assumption that in the reproduction of the property the duration of the construction period would closely approximate that of the actual construction period. Interest during Construction has been calculated and predicated on the assumption that funds would be currently available as needed throughout the construction period and at an annual rate of interest sufficient to attract capital to investment in the enterprise.

An allowance for Cost of Financing would usually be included in a valuation of this type. Our decision to omit this item is due to the fact that none of the outstanding securities of the companies has ever been offered for sale to the public. Construction funds in total for the project were provided by participants in the enterprise and each participant has received securities of the companies in proportion to the amount of cash so provided.

The amount included for Working Capital has been computed from the operating reports of the companies as of the date of valuation. It includes cash and/or equivalent working capital necessary in the ordinary conduct of the business, together with gas currently in the lines and necessary materials and supplies on hand. The amount so calculated is believed to be the minimum amount with which the companies can successfully operate.

As previously stated, this valuation includes no item of an intangible nature. We have been advised that the important item of Going Concern Value has been made the subject of study and will be dealt with in a separate report.

In conclusion, we wish to express our appreciation of the courteous and helpful cooperation given our engineers by all employees of the companies.

Yours very truly,
F. C. Hamilton.
F. C. Hamilton.

TEXOMA NATURAL GAS COMPANY

SUMMARY OF COST OF ATTACHING BUSINESS

Page #1

Description	1932	1933	1934	1935	Total
	OX	OX	OX	OX	OX
1 - Cost of Soliciting Business (New Business Department Expense)	$ 86,105.00	$ 219,149.00	$ 889,060.00	$ 373,477.00 (1)	$ 1,567,791.00
2 - Cost of Providing Facilities in Advance of Attached Business					
Total Fixed Charges Paid					
Interest	$3,666,350.00	$3,625,079.00	$3,598,329.00	$3,474,732.00	$14,364,490.00
Ad Valorem Taxes	301,776.00	301,689.00	270,558.00	289,193.00	1,163,156.00
Depreciation	386,529.00 (2)	386,529.00 (2)	386,529.00 (2)	386,529.00 (2)	1,546,116.00
Total	$4,354,655.00	$4,313,237.00	$4,255,416.00	$4,150,454.00	$17,073,762.00
Portion of Capacity Provided in Advance of Attached Business (Percent)	51.98	56.75	21.42	3.63	-
Fixed Charges on That Portion of the Capacity Provided in Advance of Attached Business					
Interest	$1,905,769.00	$2,057,232.00	$ 770,762.00	$ 126,133.00	$ 4,859,896.00
Ad Valorem Taxes	156,863.00	171,174.00	57,954.00	10,498.00	396,489.00
Depreciation	200,918.00	219,355.00	82,795.00	14,031.00	517,099.00
Total	$2,263,550.00	$2,447,761.00	$ 911,511.00	$ 150,662.00	$ 5,773,484.00
3 - Cost of Operating Facilities Provided in Advance of Attached Business					
Expenses Not Affected by Volume of Gas Handled	$1,072,759.00	$ 835,903.00	$ 770,616.00	$ 819,759.00	$ 3,499,037.00
Portion of Capacity Provided in Advance of Attached Business (Percent)	51.98	56.75	21.42	3.63	-
Expense of Operating Facilities Provided in Advance of Attached Business	557,620.00	474,375.00	165,066.00	29,757.00	1,226,818.00
GRAND TOTAL COST OF ATTACHING BUSINESS	$2,907,275.00	$3,141,285.00	$1,965,637.00	$ 553,896.00	$ 8,568,093.00

What?

NOTES - (1) Includes $65,471.00 paid in 1936 but contracted for in 1934 and 1935. — when you K for oil in 1935 & pay for in 3 to what yr do you chge it?

(2) Viewed depreciation as of 6-1-39 has been testified to as being $2,866,758.00 which would mean $386,529.00 per year.

Explanation of Method Used in Determining Reserves As of August 1, 1931, On Acreage Owned by Texoma Natural Gas Company January 1, 1939.

Dear Mr. Dickinson:

In calculating the reserves underlying the acreage owned by Texoma Natural Gas Company on January 1, 1939, but as of August 1, 1931, I used the same method used in determining reserves for Texoma's leases as of January 1, 1939, as described on Pages 3 and 4 of Exhibit No. 43, and divided the acreage into the same approximately 506 tracts mentioned in that exhibit. The total reserve for Texoma's acreage was then determined by adding up the reserves figured for all these tracts. In this manner was determined the total original recoverable reserves underlying the acreage owned by Texoma Natural Gas Company on January 1, 1939. At the time that these original recoverable reserves were figured, there was also determined the amount of gas which would remain in the reservoir at the assumed well head abandonment pressures designated and with a 90% recovery factor applied.

In figuring the recoverable reserves underlying the acreage owned by Texoma Natural Gas Company on January 1, 1939, as of August 1, 1931, at the assumed well head abandonment pressures designated, the actual absolute reservoir rock pressure was determined as of August 1, 1931, and the proportion of this absolute rock pressure to the original 471 pound rock pressure, applied to the original reserves underlying each tract. Then the reserves determined for all the tracts were totalled and from this amount was subtracted the amount of gas which would be left in the reservoir at the designated abandonment pressures with a 90% recovery factor. This process resulted in the amounts noted below at the varous designated well head abandonment pressures and it will be noted that this reserve at an assumed well head abandonment pressure of 0# gauge was 2,505,680,723 MCF.

In determining the rock pressures of each of the approximately 506 tracts used, for August 1, 1931, the following method was used. The writer has in his possession rock pressure records of wells drilled prior to August 1, 1931, which give rock pressures prior to and shortly after August 1, 1931. From these records, the rock pressures as of August 1, 1931 were computed. These rock pressures were plotted on the writer's 1932 rock pressure map and showed at each well used the difference between the rock pressures as of 1932 and August 1, 1931. Information on enough wells was available so that enough control was obtained to determine what differences occurred between the 1932 rock pressures and the 1931 rock pressures, in the different areas.

Each tract was plotted on the map and the rock pressure of its center determined. When the tracts did not occur between wells with 1931 rock Pressures, and would therefore not be directly scaled, the differences noted in
2175 that area between 1931 and 1932 rock pressures were
applied to the 1932 rock pressure contours to determine the 1931 rock pressure.

For this work, the writer used rock pressure records of wells which had been acquired and drilled by Texoma Natural Gas Company at that time, and wells drilled prior to August 1, 1931, by Canadian River Gas Company and Panhandle Eastern Pipe Line Company in Moore and Hutchinson Counties, Cities Service Gas Company in Carson and Gray Counties, and the Lone Star Gas Company in Wheeler County.

The following tabulation shows the results obtained:

Texoma Natural Gas Company Reserves—August 1, 1931
Leases Owned Jan. 1, 1939—Pressure Base 16.4#—90%
Recovery Factor Used

Abandonment Pressure Pounds Gauge At Well Head	Reserves M. C. F.
0#	2,505,680,723
25#	2,349,536,607
50#	2,187,387,385
75#	2,025,240,991
100#	1,869,096,876
125#	1,708,947,653

Very truly yours,
(Signed. C. J. Peterson)
C. J. Peterson,
Chief Geologist.

TRANSCRIPT OF RECORD

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, 1941

No. 265

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION, PETITIONERS

vs.

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY

No. 268

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY, PETITIONERS

vs.

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION

ON WRITS OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT

Petitions for certiorari filed July 12, 1941, July 14, 1941

Certiorari granted October 13, 1941

IN THE

United States Circuit Court of Appeals
For the Seventh Circuit

No. 7454

NATURAL GAS PIPELINE COMPANY OF AMERICA
AND TEXOMA NATURAL GAS COMPANY,
Petitioners,

vs.

FEDERAL POWER COMMISSION AND ILLINOIS
COMMERCE COMMISSION,
Respondents.

5

Petition for Review of Interim Order of the Federal Power Commission.

INDEX.

Petition of the Illinois Commerce Commission, filed with the Federal Power Commission, September 23, 1938 1
Order of Federal Power Commission instituting Investigation, entered October 14, 1938 6
Answer of Natural Gas Pipeline Company of America and Texoma Natural Gas Company to Petition, filed November 16, 1938 9
Order fixing date of hearing, entered April 14, 1939 13

PROCEEDINGS AT HEARING.

Statement by Examiner 15
Statement by Mr. Morgan 16
Colloquy 25, 33, 64
Statement by Mr. Booth 28
Statement by Mr. May 31

ABSTRACT OF TESTIMONY.

WITNESSES FOR FEDERAL POWER COMMISSION.

Testimony of:

Brown, Claude C. 35, 36
Knapp, Charles W., Jr. 2004, 2103, 2588
Smith, Charles W. 2041, 2222, 2632

WITNESSES FOR ILLINOIS COMMERCE COMMISSION.

Testimony of:

Kleinman, Fred 2075, 2382
Ostrander, E. D. 1977, 2277
Woodford, John M. 57, 393

Vol. I, pp. 1 to 646; Vol. II, pp. 647 to 1310; Vol. III, pp. 1311 to 1976; Vol. IV, pp. 1977 to 2672; Vol. V, pp. 2673 to 3031; Vol. VI, pp. 3033 to 3417; Vol. VII, pp. 3419 to 3902; Vol. VIII, pp. 3903 to 4022.

WITNESSES FOR DEFENDANTS.

Testimony of:

Biddison, P. McDonald.......1041, 1284
Brainard, W. F.......481
Brown, Floyd C.......491, 1311, 1636
Bulla, W. T.......987

vidual company, and depends on the character f the territory and the competitive position of ther fuels such as coal, oil and electricity.

NATURAL GAS INDUSTRY

mpetitive sition:

vorable

Persistent growth has been the outstanding characteristic of the natural gas industry. The 1929-32 depression proved to be only a temporary check, and new output reds have been established in each year since 1934. en disregarding probable gains in business acity, the outlook would favor continued growth. e reasons are: 1) Vast new sources of supply h long-lived reserves have been developed in Southwest and in California within the last ade, allaying fears as to the industry's life. Extensive new pipe line transportation systems e been built to carry this gas to the large ulation centers, notably those of the Middle t and Great Lakes regions. This has opened new markets for future exploitation. Natural gas is clean and has a higher heat than manufactured gas. Moreover, it can successfully mixed with manufactured gas. most localities, natural gas is cheaper so that can compete successfully with coal and oil as strial fuel. Even in the heart of coal and oil ducing regions, natural gas is being sought on rice basis. Moreover, as costs and prices geny advance with industrial recovery, or infla-, the cost of natural gas should be among the t affected. 5) Large gas utility companies aldy operating in industrial centers have found it rable to take over the distribution of natural which has generally made it unnecessary to licate sales and administration facilities. Furrmore, privately owned utilities have been able rotect themselves against the threat of munil competition by securing contracts for the ivery of natural gas.

However, implications as to aggregate profit ins are not so clearly defined. As the result accelerated oil well drilling during the past w years, many natural gas wells have been rought into production by corporations not in the gas business. This product has forced competitive rate reductions in producing areas, particularly as regards industrial rates. More important has been increasing agitation for lower domestic rates, again more noticeable near producing areas. This is an unfavorable development since the domestic demand, carrying the higher rates, is relatively inelastic. Finally, the production of natural gas is basically an extractive industry. Consequently, unit costs tend to rise as individual fields mature.

Although new industrial uses are constantly being developed for natural gas—a recent example is in the manufacture of explosives—earnings still depend largely upon domestic demand. As this represents house heating to a fair degree, sales and earnings vary with temperature conditions.

Increasing Regulation:

Outlined

Following passage of the Natural Gas Act in June, 1938, closer supervision is outlined for this division of the utility industry. The legislation places natural gas companies engaged in interstate commerce under the jurisdiction of the Federal Power Commission. Only

(a) Based on consumption of 10.6 therms. (b) Based on consumption of 30.6 therms. (See Note).

Note: In order to put the prices upon a comparable basis it was necessary to convert the normal consumption requirements used for computing monthly bills into an equivalent heating value expressed in therms. Average residential requirements per month for each of four combinations of service are as follows—Range, 10.6; range and manual type water heater, 19.6; range and automatic storage or instantaneous type water heater, 30.6; range, automatic storage or instantaneous type water heater and refrigerator, 40.6. Indexes for the 2 services (10.6 and 30.6 therms) are based on data from the following number of cities: Manufactured Gas, 40 cities in Mar., 1923, decreasing to 25 cities by June, 1936; Natural Gas, Mar., 1923, 7 cities, increasing to 18 cities by June, 1936; Mixed Gas, Mar., 1923, 3 cities, June, 1936, 7 cities. The Combined Index is based on 50 cities throughout.

*Companies formerly distributing manufactured gas but which were distributing natural gas at the beginning of 1937 have been excluded from the above tabulation for all eight years. The data shown above for 1929 to 1936 are therefore not comparable with data of the manufactured gas industry previously issued for those years.

II. THE NATURAL GAS INDUSTRY

While the natural gas industry had its beginning over a century ago, its importance and development came much later than the manufactured gas industry, and in fact the growth since 1921 has been far greater than in any other period. In these recent years investment attention has been drawn to the industry as a branch of the public utility field of increasing importance, and this interest was especially apparent from 1929 to 1931, during which period there was much new construction and extension of long distance natural gas pipe lines throughout the country.

Growth of the Industry

Natural gas was first used and developed extensively in what are known as the Appalachian fields, located in western New York and Pennsylvania, eastern Ohio, West Virginia and northern Kentucky. With the rapid development in the oil industry, gas fields were discovered in connection with oil drilling. At first this gas was considered a by-product of relatively small value but its importance has since been well recognized and wastage of gas is being curtailed by state legislation. The new fields to develop in connection with the oil industry were the Monroe and Richland fields in Louisiana, the Amarillo field in Texas, the Hugoton field in Kansas, the Oklahoma fields and the Kettleman Hills, Button Willow and Ventura fields in California. With the discovery of immense resources of natural gas, the fear that exhaustion of supply would prohibit the extensive development of the industry has passed and today it is estimated by geologists that the country's supply is sufficient for many years to come.

In following the growth of the industry, statistical information is not as complete as in the case of manufactured gas. However, the following figures representing a compilation of reports of the U. S. Bureau of Mines, reflect the annual growth since 1906.

Natural Gas Production, Revenues and Customers

(Including Mixed Gas)

*Includes only gas marketed, does not cover gas blown into the air or otherwise naccounted for. †Figures not available.

Production has expanded faster than the number of customers, reflecting the gradual extension of supply to large industrial users. The gain in customers in 1931, 1932 and 1933 was due chiefly to a gain in the number of consumers using natural gas mixed with manufactured gas. The companies reporting to the American Gas Association showed a 10% drop in gas sales and a 5% drop in revenues in 1938 in reflection of economic recession and generally warmer winter weather.

The amount of gasoline recovered through treating natural gas expanded prior to the depression, as a result of more efficient technique and the increase in gas produced for consumption in the oil fields. It is interesting, however, to note that in contrast to production from "dry gas" wells, the amount of gas available from oil wells depends on the crude oil requirements of oil companies. The value of the oil output of these wells is, of course, far greater than that of natural gas and consequently the gas supply available for distribution fluctuates widely due to variations in oil production and the drilling of new wells. Since 1929 the amount of natural gas treated for the recovery of natural gasoline has several times exceeded the total marketed production due to the fact that natural gas was allowed to escape into the air for want of a market after being treated.

Exhibit No. 169.

† Included under "Others."
‡ Alabama and Texas included with Louisiana.
§ Includes Alabama.
¶ Includes gas piped from Oklahoma and consumed in Arkansas.
** Includes New Mexico: 1937, 46,337; 1936, 33,928; 1935, 27,931; 1934, 24,075.

2505 The above table shows the growth of the various gas fields over the past 30 years. The tremendous change that has taken place in the output of the various states is shown by the fact that in 1906 Pennsylvania and West Virginia accounted for approximately 65% of the total United States production, whereas in 1937 they accounted for only 11% of the total. The States of California, Lousiana, Oklahoma and Texas, which together produced only a little over 1% of the total in 1906, now account for approximately 75% of all gas produced in the United States. By 1920 the southeastern fields and the California fields had already assumed considerable importance, accounting for approximately 40% of the total production in that year. The greatest increase in any state has been in Texas, which in 1920 produced only 37,000,000 cubic feet and in 1937 over 850,000,000. A substantial part of the increase in these fields is due the opening up of new wells, but part is also due to the utilization of gas which was previously blown off in the air and wasted. Some idea of the extent of this waste can be gained from the fact that from 1920 to 1932 it has been estimated that approximately 35% of the total natural gas production in California was wasted. In the last few years, however, regulation has reduced wastage.

†Included in miscellaneous industrial.

*Includes petroleum refineries.

The foregoing table shows the trend of total consumption and the consumption by groups over the past eighteen years. From 1920 to 1929 the proportion of gas taken by industrial consumers was constantly increasing, rising from 62.5% of the total in 1921 to 81.0% in 1929. With the decline in business activity, industrial consumption was curtailed, while domestic consumption, because of the extension of pipe lines to large centers of population in 1929, 1930 and 1931, continued to increase. The combination of these two factors caused a drop in the percentage of gas taken by the industrial consumer from 81.0% in 1929 to 75.6% in 1934 but with the revival of general business activity this percentage rose to 80% in 1937 and it is expected that the long-term trend of an increasing proportion of the product being absorbed by industrial consumers will continue.

* 000's omitted. ** Includes electric public utility power plants and petroleum refineries.

The preceding table shows the amount of revenues contributed by each class of consumer. From 1923 to 1929 the proportion of revenues contributed by industrial users showed a steady gain, rising from 40.7% in 1923 to 46.0% in 1929. From 1929 to 1932, inclusive, the decline in industrial revenues was more drastic than the decline in sales, and in 1932 revenues from this source amounted to only 30.4% of the total. As in the case of industrial sales, a pick-up in the proportion of revenues contributed by industrial consumers to 37.5% of the total occurred in 1936. Revenues from gas used in the field amounted to 6.0% of the total, and that used in the carbon black industry to 0.8%. It is apparent that while these two industries are important from the viewpoint of the consumption of gas taking nearly 42% of the total, they contribute an insignificant amount, 6.8% of total revenues.

This table, derived from the two previous ones, shows the price paid per unit for gas used by the various consuming groups. It brings out the tremendous difference in the price paid for gas by the different consumers. In fact, the price paid for gas to manufacture carbon black and for field use is so low that sales in these categories should be eliminated in measuring the progress of the industry. The price per unit of gas sold to domestic and commercial consumers has in recent years tended to rise because a growing proportion is sold at points more distant from production centers than formerly. Revenues per unit of gas sold to miscellaneous industrial consumers, on the other hand, has been generally downward since 1927 because of the larger proportion of gas sold in the lower priced part of the group. The price per unit of gas sold for field use has also been declining. In this group the price per unit is dependent on many factors, such as the price of fuel gas, available supply of natural gas, and the demand for fuel for drilling and pumping purposes. The price per unit of gas sold to the carbon black manufacturer has been irregular, varying with the demand for carbon black and the available supply of gas for which there is no demand by the other consuming industries. The average price of gas sold for all sources was downward until 1930 because of the increasing proportion of the product taken by the groups paying low prices and also the decrease in the price paid by those consumers. Since 1932 it has again declined.

2506 Domestic Consumption

The trend of domestic and commercial consumption combined has been steadily upward for the past decade, increasing 51% from 1919 to 1932, declining 4.5% in 1933, increasing 2.9% in 1934, 9.1% in 1935, 9.0% in 1936 and 7.5% in 1937. The gain in sales and revenues continued through most of the depression as a result of the extension of pipe lines to densely populated areas which were previously served only by manufactured gas. The most notable examples were the Detroit line which connects the city of Detroit with the Texas, Panhandle and the Hugoton, Kanses fields and the Chicago line, which pipes gas from the "Panhandle" in Texas to the city of Chicago. In the latter case the gas is then mixed with the manufactured product and distributed throughout the entire city. While we have no figures indicating the experience of domestic sales, exclusive of business gained because of the extension of pipe lines, figures from individual companies and individual states indicate declines in both sales and revenues were experienced during the depression. Per capita consumption by domestic and commercial users has dropped quite steadily as the number supplied with mixed gas has increased.

Mainly as a result of an increase in the proportion of gas consumed in areas at some distance from the points of production, the price per unit of gas sold to domestic and commercial consumers has risen over the long term. Obviously, the cost per unit of gas in Chicago is greater than at the point of production in Texas. Since we expect a continuation of the growth of long distance pipe lines and of consumption at points far removed from the production centers, we look for a continued rise in the average price per thousand feet of gas sold for domestic and commercial purposes, which, however, is more than offset by the increase in heating value resulting. The average price per 1,000 cubic feet paid by domestic and commercial consumers varies widely, depending largely on the distance from the producing field. For example, in 1937 average domestic and commercial prices (combined), ranged from about $1.18 per 1,000 cubic feet in Illinois and Michigan to 36 cents in West Virginia. (See "Summary of Natural Gas Statistics" below.)

Miscellaneous Industrial Consumption

Consumption in this category increased more rapidly than domestic consumption from 1925 to 1929, but fell off sharply in 1931 and 1932, increasing the five following years to far above the previous peak. The principal consumers in this group are the steel, glass, brick and cement industries. In the first three named, the product, because of its cleanliness and the ease with which the temperature may be controlled, has a special value. In the cement industry, however, the only question that arises as to the desirability of the fuel is the cost per heat unit.

Petroleum Refineries: Consumption of natural gas at petroleum refineries declined steadily until 1934, as many refiners found it cheaper to utilize fuels made at their plant (fuel oil, refinery gas, and coke) than to buy natural gas from outside companies. Since 1934, however, this trend changed as the price of fuel rose.

Electric Public Utility Power Plants: The quantity of natural gas used in electric public utility power plants increased rapidly through 1931, more so than in any other industry. This has followed from the extension of lines making available a fuel often cheaper than coal or oil and, while the trend was interrupted in 1932 and 1933, it was resumed in 1934 with the revival of electric consumption, sales reaching a new high in 1937.

Field Uses: This category includes gas used for drilling, pumping, and other field purposes, in connection with the production of oil and gas. The use of gas for this purpose has constituted the largest item in consumption since natural gas statistics were first compiled. This widespread use of gas in the field is chiefly the result of its accessibility. The consumption of gas for this purpose has increased approximately 300% since 1919. The increase is a reflection of the discovery of new gas fields. However, the decline since 1929 is a result, not only of the decline in general business activity, but even to a greater extent of the fact that the east Texas oil fields, which now produce a large portion of the total oil, have an abnormally low gas-oil ratio. Had the east Texas fields been normal as regards gas production, many wells drilled with fuel oil would have been drilled with gas and the national total for field purposes would have shown a much smaller decline.

Carbon Black: The use of natural gas as the raw material for the manufacture of carbon black, which had increased rapidly up to 1930, slumped sharply in the two subsequent years. This substantial decrease resulted primarily from voluntary restrictions placed on production by the carbon black producers. As can be seen from the above table, the price paid for gas for this purpose is extremely low, and represents the utilization of gas which otherwise might have gone to waste. The carbon black industry moves toward the center of greatest production, where the fuel is cheapest, and about 20% of the total carbon black is produced in Louisiana and nearly all the rest in Texas, as a result of the expansion of the natural gas industry in those states. As conditions in the carbon black industry have shown improvement since 1933, consumption rose to a new high in 1937.

These tables, taken from the American Gas Association reports, are not comparable to data taken from the Bureau of Mines reports. The industrial figures shown by the latter organization include gas sold for field purposes and for the manufacture of carbon black while the Association excludes gas sold for such purposes. The Bureau of Mines also includes companies supplying mixed gas while the A. G. A. excludes them.

2507 Domestic sales show a wide seasonal variation, usually reaching their peak in January and dropping until August, in which month average sales are but a fraction of those of January. Because of the negligible variation in industrial sales and their preponderance in the total the latter shows only a samll change from month to month. Domestic revenues vary less than domestic sales, this difference being due, for the most part, to the prevalence of a fixed minimum monthly charge and a rate schedule based on progressively lower rates with increased consumption.

The above tabulations of the Bureau of Mines show the trend of natural gas consumption by states over the past eight years. The figures include sales of mixed gas and consequently reflect the full effect of the extension of the long distance pipe lines. It should be noted in connection with this table that industrial sales in Texas and Louisiana include large quantities of gas sold for carbon black manufacture at prices as low as 1.6 cents per 1,000 cubic feet and for field purposes in Texas and Oklahoma at prices as low as 3.1 cents as compared with the average price of 10 cents for all gas sold for industrial purposes in 1937. Accordingly, total industrial sales are not a good index of the prosperity of the industry in the various states. Revenues from miscellaneous industrial sales, which reflect the growth of the consumption of the higher priced industrial gas, and domestic sales and revenues afford the best measurement of the essential development of the industry. California and Texas, which are two of the four largest consuming states, showed a tremendous expansion in domestic revenues during the period, Pennsylvania a decline and in Illinois, which is now the fourth largest domestic revenue producing state, domestic sales and revenues made practically their entire gains since 1930, mixed gas being introduced in and around Chicago in Oct., 1931. The greatest gains in recent years in industrial revenues occurred in Illinois, New York, Nebraska, Missouri, Montana and Tennessee.

Summary of Natural Gas Statistics, 1937

Interstate Transportation of Natural Gas

The total quantity of natural gas transported across the State borders in 1937 was 19% above 1936 and 45% above 1935 and aggregated 687,480,000,000 cubic feet, which was equivalent to about 28% of the total production compared with 24% in 1935. The principal interstate movements were from Texas, Louisiana and West Virginia, exporting approximately 203 billion, 153 billion, and 103 billion cubic feet, respectively. Louisiana shipped most of its gas to Texas, Arkansas and Illinois. Texas exported the most to Illinois, Kansas, Colorado, Missouri, Iowa, Oklahoma and Indiana, while West Virginia shipped the largest portions to Ohio and to Pennsylvania. The shipment of gas from the other states was not so large, but Kansas, Pennsylvania, Kentucky and Oklahoma exported between 41,000,000 and 45,000,000 M cubic feet each.

Consumption of Natural Gas Used with Manufactured Gas in the United States in 1936, by States

[*] Revised figures.

The above table of the Bureau of Mines reflects the extension of natural gas pipe lines to cities and towns previously served with manufactured gas alone. The large increase in sales and revenues between 1930 and 1932 is due to the fact that the figures for 1930 and 1931 reflect sales for only part of the year, as natural gas was used in many cases for the first time in those years. Thus these figures do not represent the trend but, rather, the first phase of the utilization of the mixed product. Reflecting the sale of mixed gas in the city of Chicago since the latter part of 1931, the State of Illinois supplied by far the greatest amount of revenue from this source, revenues amounting to approximately 42% of the total in this country, while revenues from this source in New York constituted an additional 15%.

Development of Natural Gas Transmission

During the early years of the natural gas industry, the product was used only locally in the general territory adjacent to the fields of production. However, with the growing realization of its uses, and the discovery of large reserves, an extension of the area of distribution was undertaken by the construction of pipe lines similar to those used in the oil industry. There has been a steady expansion in pipe line mileage since the beginning of the industry. It was only in 1927, however, with the development of electric welding and other improved methods of constructing pipe lines that the construction of long, large-diameter, natural gas lines was begun. Construction of these lines increased through 1928, 1929 and 1930, but declined in 1931 and almost entirely stopped from 1932 to 1936. This decrease in new construction was due chiefly to the fact that the major projects holding most promise of success were completed or well under way before 1931.

No complete survey of natural gas pipe lines, covering mileage and sizes, has been made. However, the Federal Trade Commission estimated that as of June 30, 1932 there were approximately 52,000 miles of natural gas trunk lines in the country as compared with about 40,000 miles in 1929. Since 1932 few important lines have been built, the principal being from Douglas to Tucson and Phoenix, Ariz., from Rockville, Ind. to Detroit, Mich. and the additional capacity provided for these lines. In June, 1932, the natural gas lines were operated in all but 13 states (the six

New England states, Del., N. C., S. C., Wisc., Nev., Idaho and Oregon). Texas leads in mileage. Other states with extensive systems are Ohio, Oklahoma, Kansas, Louisiana, Mississippi, Pennsylvania, West Virginia, Arkansas, Kentucky, New York, Wyoming and California. The major pipe line systems consist of those running from the "Panhandle," Texas, to (a) Chicago, Ill., (b) to Omaha, Des Moines, and Minneapolis (c) to Detroit and (d) to Denver. There are other important lines between the Monroe-Richland District and (a) Atlanta, Birmingham and Montgomery, and other cities in the south, (b) St. Louis (Mo.) and (c) New Orleans, La.; the lines from the Kettleman Hills Field to San Francisco and Los Angeles in the far west, the line from Kentucky to Baltimore and Philadelphia via Washington, D. C., in the east, and the line from the Cut Banks Field in Montana to Helena, Anaconda and Butte in the northwest. Other smaller systems consist of the lines from the Louisiana Field to Monterey, Mexico, one from New Mexico to El Paso, Texas and to Bisbee, Douglas and Phoenix, Ariz., and from Wyoming to Salt Lake City and Ogden, Utah.

The extension of these trunk lines into areas which previously were not supplied with gas, and the sale of the fuel at wholesale to the companies formerly distributing manufactured gas in the cities en route is similar to the developments followed by the electric power and light industry in recent years. These developments necessitating physical connections and tie-ins encourage the consolidation of natural gas properties into larger and larger units. The phase of development consisting of the building of large trunk lines, although probably not yet completed, appears to have reached its peak. However, the expansion and extension of small lines from these trunk lines to large and small communities is still in an early stage of development. Conditions existing during the depression were not propitious to such developments, but with the lifting of the depression new developments along this line have been carried on. This phase of the industry is still quite young. In building long distance lines many problems arise, including the type of line construction, cost of the right of way, pressure of gas coming from the well and existing soil through which the pipe must pass, consequently construction costs vary widely, other factors include climatic conditions along the route, the maintenance cost of the lines and, most important of all, the possible market and the rate at which the gas can be sold there.

Regulation of Interstate Transmission

On June 21, 1938 Congress enacted legislation providing for regulation by the Federal Power Commission of interstate transportation and sale of natural gas for resale for ultimate public consumption. The principal features of the Act are summarized as follows:

1. The production and gathering of natural gas, local distribution and direct pipeline sales for industrial use are not subject to the Act.

2. Exports to and imports from foreign countries must be approved by the Commission.

3. Rates must be filed with the Commission and changes approved by the Commission, which may initiate hearings and suspend the effectiveness of rate changes for five months; the Commission may not suspend effectiveness of rate changes affecting sales for resale to industrial customers.

4. The Commission may determine the reasonableness of rates on its own motion or on complaint and may fix rates by its orders, except that it may not initiate rate increases; it may also determine costs where it has no authority to fix rates, either on its own motion or at the request of a regulatory commission.

5. The Commission may determine the actual legitimate cost and depreciation therein of physical property and may require the filing of physical inventories, the original cost thereof, and the cost of all additions and retirements.

6. The Commission may direct extension or improvement of facilities and the extension of service to local distributors adjacent to its facilities if the Commission finds no undue burden will be placed upon the company thereby. The Commission may not compel the above extensions, etc., if they would impair the company's ability to render adequate service.

No abandonments of property subject to the Commission may be made without permission based on either depletion of the gas supply or public convenience or necessity.

Certificates of convenience and necessity shall be obtained before a gas line may be extended to a market in which natural gas is already being served by another company. Policy in granting certificates of convenience and necessity should seek service at "lowest possible reasonable" rates.

7. The Commission may prescribe accounts, records, cost accounting procedure, etc., except that the company shall not be relieved from requirements of state law.

8. The Commission may require depreciation accruals at rates it prescribes.

9. The Commission may require reports, subpoena witnesses, etc., of operating companies, and may examine their records and those of companies directly and indirectly controlling them insofar as the latter's records relate to transactions with controlled operating companies.

Legal Investments

Public Utility bonds legal for savings bank investments in various States are tabulated in the blue insert. The bonds are arranged alphabetically with the legal status given for the States of California, Connecticut, Maine, Massachusetts, New Hampshire, New York and New Jersey. An additional feature following this tabulation are lists of public utility securities eligible for fiduciaries in New Jersey and Pennsylvania.

Expanding Markets for Gas Industry Make Investments Sound

The gas industry today faces the future in a sounder and stronger position than at any time during the past decade, Percy S. Young declared in an address on "Investment Attributes of Gas Utility Securities," presented May 15 in San Francisco at the Executive Conference of the American Gas Association. Mr. Young is chairman of the Executive Committee of the Public Service Corporation of New Jersey and a past president of the Association.

After stating the many favorable characteristics of gas industry securities, Mr. Young cited the expanding market for gas. He summarized the principal segments of the gas market as follows:

(1) Cooking.—The modern gas range is a remarkable achievement. It is more efficient, excels and out performs any of its competitors. Public acceptance has been immediate and enthusiastic. The modern gas range has placed gas in a preeminent position in household economy. During the year 1938 over one million new gas ranges were sold.

(2) Water Heating.—This field offers one of the greatest opportunities for the expansion of a highly desirable load. Lower initial costs and substantial improvements in efficiencies have met customer requirements and public acceptance has followed. Sales of 740,000 water heaters in 1938 exceeded previous years' sales while the sales of many non-gas using major home appliances showed marked decreases.

(3) Refrigeration.—Gas refrigerators continued their extraordinary public acceptance and relative sales results were better than other types of automatic refrigerators during 1938.

(4) House Heating.—Faced with keen competition gas house heating has made outstanding gains. Manufactured gas sales for residential house heating increased every year throughout the depression, and in 1938 were almost four times the 1929 sales. Gas house heating entrenches the three other services of cooking, water heating, and refrigeration.

(5) Air Conditioning.—The market for air conditioning is rapidly growing. Air conditioning equipment can be used to good advantage wherever people live, work, or play. The application of gas-operated absorption type direct dehumidification equipment as applied to the air conditioning field is making excellent progress. Air conditioning has been termed the nation's next great business. It carries a great opportunity for the gas industry.

(6) Commercial and Industrial Use.—The future of commercial and industrial gas sales is decidedly bright. The steadily increasing demand and acceptance of gas in this field over the past nine years, when, despite adverse business conditions, sales increased almost 30 per cent, indicates the commanding position attained by the industry.

EXHIBIT NO. 171.

The Investment Attributes of Gas Utility Securities

By Percy S. Young
Public Service Corporation of New Jersey, Newark, N. J.

The soundness of the gas industry from the long term point of view is unquestioned. It is one of the three large public utility industries using the public streets for the service of the public. The approximate investment in plant and equipment of these industries as of January 1, 1938, was: electric, light and power—$13,000,000,000; telephone (Bell Companies)—$4,400,000,000 and gas—$4,400,000,000. From 1929 to 1937 there was invested approximately $2,000,000,000; $300,000,000; and $400,000,000 in the electric light and power, telephone, and gas industries, respectively. While operating income decreased for all three industries during this period, it is significant that this decline was in face of a substantially smaller amount of new invested capital on the part of the gas industry. During the 10-year period from 1929 to 1938, which except for the first year broadly covers a period of depression, it is found that each of these industries has shown remarkable stability. Revenues were as shown in Table No. 1.

From 1929 to 1933, the low point of the depression in revenues of only 19½ per cent for the telephone industry, while the decline for the electric light and power industry and the gas industry was only 9½ per cent and 13 per cent, respectively.

Investment Characteristics

Investment in plant and equipment by the gas industry is in property of long life accompanied by low rates of depreciation. It does not suffer the substantial plant losses which often accompany revoluationary technological changes in many other industries but can benefit from the technical improvements now being developed for more efficient production. Its raw materials are not subject to wide price fluctuations and its by-products are bringing an increasingly larger return because of a widening demand. The amount of labor employed is small in relation to total expenditures for production and distribution. It is relatively free from political attack and direct governmental competition. The prospects for obtaining a balanced load with greater diversity are improving and should result in a greater utilization of plant. Its rates are generally competitive and are subject to adjustment upward without appreciable loss of business under the present system of state regulation should economic changes require such revision. Because of its stability, lower ratios of earnings to fixed charges can be maintained without detracting unduly from the investment appeal of its senior securities.

Mr. Young, who is chairman of the executive committee, Public Service Corporation of New Jersey, Newark, N. J., presented the paper, "Investment Attributes of Gas Utility Securities," before the Executive Conference of the American Gas Association, Fairmont Hotel, San Francisco, Calif., May 15, 1939. Excepts from this paper are published herewith.—Editor.

Investor Experience

The author is indebted to Dean John T. Madden and Dr. Herbert B. Dorau of New York University for statistical material recently prepared under their direction dealing with the experience of investors in public utility securities during recent years. This analysis necessitated a study of the following factors: (1) the changing market value of the securities; (2) the extent to which interest and dividends were paid; (3) receiverships.

They point out that usually there is a tendency to understate or overstate the investor's relative status at specific times by ignoring the interest and dividend record and by measuring it only in terms of the market value of the securities which he holds. The maintenance of interest and dividend payments over an extended period should be given at least as much weight as the record of market price. Furthermore, the record of receiverships among divisions of the industry and a comparison with other industries is valuable in testing the experience of investors in a selected industry.

The experience of investors in gas utility securities has been exceptionally favorable. The record indicates unquestionably and that they have been underrated, and that they compare quite favorably with the record of straight electric and combination electric and gas company securities.

Market Value Changes

The survey of the amounts invested in public utility bonds and preferred stocks of both holding and operating companies by types of service and a comparison of relative profits and losses, as measured from issue prices, illustrate how the holders of securities of each type of service fared on selected dates over an extended period including one of the worst deflations on record.

The distribution of public utility bonds in terms of type of service is shown in Table No. 2.

Although a large proportion of the total invested of over six billion dollars is represented by issues of straight electric and electric and gas companies, it does not detract from the value of comparison and an examination of relative profits or losses as measured from issued prices is interesting. (Table No. 3.)

As of December 31, 1933, the date at which the maximum loss was recorded, the bonds of straight electric companies were selling 29.9 per cent below issue price; the issues of gas and electric companies 21.9 per cent and gas companies 24.3 per cent. On December 31, 1936, the bonds of straight electric, gas and electric, and gas companies had all advanced above issue price and were 1.3, 2.0, and 2.2 per cent, respectively, above their issue prices. The issues of gas companies declined slightly more rapidly in the earlier years of the depression than straight electric and combination electric and gas issues. Except for the issues of combination electric and gas companies, they did not, however, decline nearly so far at the end of 1933 as the other issues. Furthermore, their recovery from this point on was more rapid than any of the other issues.

The analysis of the market experience of public utility bonds from 1929 to 1937 as compared with that for other groups of bonds indicates that the record of electric and gas operating company bonds was distinctly better and further that the record of utility holding company bonds was relatively better than the other groups of bonds.

2512 **Table No. 1. Revenues from Sales to Customers (1929–1938)**
(Millions of Dollars)

Year	Electric Light and Power	Gas	Telephone (Bell Companies) (Local and Toll Service Revenues)
1929	$1,938	$785	$1,045
1930	1,990	797	1,076
1931	1,975	768	1,049
1932	1,813	723	933
1933	1,754	682	841
1934	1,831	701	850
1935	1,911	727	899
1936	2,044	767	971
1937	2,180	800	1,024
1938 (Estimated)	2,172	786	1,024

Table No. 2. Distribution of Cost to Investor of Public Utility Operating and Holding Company Bonds by Types of Service (Dec. 31, 1936)

	Number of Companies	Number of Issues	Cost to Investor (Millions of Dollars)	Per Cent
Electric	129	342	$4,089.8	67.4
Gas	31	58	396.5	6.5
Gas and Electric	49	131	1,206.7	19.9
Electric and Traction	8	17	178.8	3.0
Gas, Electric and Traction	6	18	191.9	3.2
Total	223	566	$6,063.7	100.0

Table No. 3. Per Cent Profit or Loss on Public Utility Bonds by Type o Service for Selected Dates (1929–1936)

Date	Electric	Gas and Electric	Gas	Elec. and Traction	Gas. Elec. & Traction	Total
Sept. 20, 1929	− 2.2	+ 0.7	− 3.1	− 2.1	− 3.6	− 1.7
Dec. 31, 1930	− 1.2	− 2.1	− 4.5	− 2.3	− 2.5	− 1.7
Dec. 31, 1931	−16.2	−15.5	−21.7	−18.5	−21.4	−16.6
Dec. 31, 1932	−15.6	−12.4	−15.2	−22.1	−26.9	−15.3
March 1, 1933	−20.4	−16.4	−18.8	−26.0	−35.8	−20.0

Dec. 31, 1934	−15.0	−10.2	− 9.4	−15.1	−29.7	−13.9
Dec. 31, 1935	− 2.3	+ 0.6	− 0.4	− 4.9	− 5.1	− 1.7
Dec. 31, 1936	+ 1.3	+ 2.0	+ 2.2	+ 0.5	+ 5.6	+ 1.6

An analysis of public utility operating and holding company preferred stocks by types of service showing the per cent profit or loss over the same period reveals that except for a sharper decline it follows the same general pattern as outlined above with respect to public utility bonds.

Dividend Record

A survey of interest paid on public utility operating and holding company bonds for the years 1930 to 1936 indicates that the record of interest payment has been very good and that the experience of gas utility companies within this group compared favorably with all other utility companies.

In a study of the income record of public utility preferred stocks, Jules Backman in the January, 1939, issue of Trusts and Estates arrives at the following conclusion: A comparison of the dividend experience of public utility gas and electric operating companies with that for other industries for the years 1933 and 1936 indicated that the record of dividend payments of electric and gas operating company preferred stocks was much more favorable than industries other than food and tobacco. These latter two industries reflected a high degree of stability in their dividend records and their record was about the same as that for public utility gas and electric operating companies.

A comprehensive analysis of receiverships for the years 1931 to 1936 has been compiled by Dean Madden and Dr. Dorau. This study shows that the receivership record with respect to electric, manufactured gas, and natural gas operating companies during the period under review was remarkable.

Manufactured gas operating company capitalization involved in receivership amounted to 2.4 per cent of the capitalization. That of electric operating companies amounted to 1.6 per cent of the fixed capital of the industry, while that of natural gas operating companies amounted to 6.4 per cent of the fixed capital of the industry. Involved in receiverships or defaults were 21.7 per cent of railroad capitalization despite the assistance of the Reconstruction Finance Corporation.

The data for foreign securities shows 38.5 per cent in default, real estate securities 61.7 per cent in default, and municipal securities five to 10 per cent in default. These, however, are not strictly comparable with the records for public utilities and railroads since the one deals with default while the other is concerned with receiverships. The comparison does, however, give a fairly good indication of the relative status of these types of securities as compared with securities of electric, manufactured gas, and natural gas companies.

The Industry's Future

The investment merit of the securities in any industry, obviously, is primarily dependent upon the status and future of that industry. The gas industry today faces the future in a sounder and stronger position than at any time during the past decade. During the past few years the industry has developed new vitality. While significant increases have been recorded during recent years in commercial, industrial, and house heating sales an even more important development occurred in the year 1938 during which residential sales, the base load of the industry, reversed their downward trend. For the first time since 1930 sales of manufactured gas for domestic purposes, which had suffered from adverse economic conditions, competing services and a change in customer usage, showed an upturn amounting to 1½ percent and this upturn has continued with increasing momentum during the current year.

Despite a general business decline the manufactured gas industry expanded and progressed during 1938. Over 17,100,000 customers were served by the entire gas industry during the year, the largest number ever supplied with gas, representing an increase of 180,000 over those served in 1937, a year of much higher business activity. Total manufactured gas revenues and sales increased over two per cent, while at the same time the revenues of
2513 many industries suffered declines ranging from 20 to 50 per cent.

The national advertising program, now in its third year, has been continued in harmony with an aggressive merchandising and sales promotional campaign. The results of this movement have demonstrated that the industry previously had not sufficiently publicized its development, the uses for gas, its superior efficiency, cleanliless, convenience, dependability and economy, and the tremendous strides recently made in the appliance field.

Gas for the four big domestic jobs—cooking, water heating, house heating, and refrigeration—offers the opportunity for one of the greatest advances in the history of the industry. The increasing public selection of gas as the fuel for the major household jobs is another indication of the preferred position of gas in the modern home.

The industry has recently completed a survey covering the utility characteristics of more than 104,000 one and two family homes constructed in 1938, this accounting for nearly 70 per cent of the entire number of one and two family homes built in the United States last year. For this group of more than 104,000 new and modern dwellings, of which 68,000 were located in the territory of natural gas companies, 88 per cent reported the use of gas for cooking, 74 per cent reported gas for water heating, 57 per cent used gas for house heating, while 12 per cent reported the installation of new gas refrigerators.

The amount and quality of research in all phases of the business is an outstanding achievement. Gas companies and manufacturers supplying the industry are engaged in extensive programs of development work. Revolutionary improvements have been made in ranges, water heaters, refrigerators, and other domestic appliances and further improvements are in prospect for the future. Commercial and industrial applications of gas are making notable progress. New developments in methods of producing higher B.t.u. manufactured gases, higher pressures, increased utilization of by-products, and improved efficiencies in gas production and distribution are on the horizon. Scientific investigation has not been confined to chemical and mechanical problems. Management is developing more effective rate structures, promotional activities, market analyses, cost analyses, and other aids.

The market for gas today is secure and the author is of the conviction that the field for gas in the home and industry will witness continued expansion. Let us examine briefly the principal segments of the gas market.

1. Cooking.—The modern gas range is more efficient, excels and out perform any of its competitors. During the year 1938 over one million new gas ranges were sold.

2. Water Heating.—Sales of 740,000 water heaters in 1938 exceeded previous years' sales while the sales of

many non gas using major home appliances showed marked decreases.

3. Refrigeration.—Gas refrigerators continued their extraordinary public acceptance and relative sales results were better than other types of automatic refrigerators during 1938.

4. House Heating.—Manufactured gas sales for residential house heating increased every year throughout the depression, and in 1938 were almost four times the 1929 sales.

5. Air Conditioning.—The application of gas-operated absorption type direct dehumidification equipment as applied to the air conditioning field is making excellent progress. Air conditioning has been termed the nation's next great business. It carries a great opportunity for the gas industry.

6. Commercial and Industrial Use.—The increasing demand for gas in this field over the past nine years has increased almost 30 per cent.

Conclusion

The high rank attained by investments of the securities of soundly financed and well managed electric companies and combination electric and gas companies is well merited. From the facts presented, this position should be shared by the securities of soundly financed and well managed companies distributing manufactured gas, mixed manufactured and natural gas, and natural gas companies having reserves adequate to meet requirements for a long period of years.

It has been shown that the gas business has a frontier still to be developed and that it is in a sound competitive position for all the uses in which fuel can be utilized for domestic, commercial, and industrial purposes. The industry looks upon past achievements as mere stepping stones to the broader fields of service which lie just ahead.

A Banker Analyses . . . Natural Gas Industry Investment Values

By Frank R. Denton
President, Mellon Securities Corp.,
Pittsburgh, Pa.

During the past twenty years, the development and growth in the use of natural gas has been enormous and with its increase of importance has come a material change in the attitude of the banking and investment community toward the industry.

High Credit Standing

Today your industry can borrow money at less cost than at any time in its history. In 1929 fifteen-year United States Government Bonds were selling to yield 3.4% while today fifteen-year Government Bonds yield 2.2%. This reduction of 1.2% presumably reflects the change in money rates for Government obligations are relatively risk free. During this same period the yield on bonds of some natural gas companies has been reduced twice as much as the yield on Government issues. In fact the yield on some of your industry's bonds is very comparable to that for Government issues if the tax free feature of Government bonds is considered.

The obligations of natural gas companies are today held in large blocks by insurance companies and other large investors in contrast to their small investment in the securities of your industry a few years ago. This record gives evidence of the improvement in the general credit rating of natural gas obligations. In order to understand these changes, it may be well to review the history of the industry as it appears to a banker.

The history of the natural gas business early in this century is primarily the development of larger gathering systems reaching more distance markets through larger and longer transmission lines. The story of the success of that development from a banking, investment and credit

---

Part of address before annual convention, Natural Gas Section, American Gas Association, Tulsa, Okla., May 9-11, 1939.

viewpoint can be traced directly to the linking of widespread reserves including connections between companies, thus insuring dependability of supply for a known period of time.

In the past five years the natural gas industry has reached the highest credit standing in its history. Today, it can borrow money at less cost than ever before. Since 1929, Mr. Denton points out in the accompanying article, the yield on bonds of some natural gas companies has been reduced twice as much as the yield on Government issues.

These facts reflect a significant change in the attitude of bankers and investors toward the natural gas industry. What are the reasons for this change? Mr. Denton, a national banking authority, gives four principal factors together with a word of caution against over-expansion.

In the early 1920s, two things occurred which marked another era in the natural gas business, and which taken together greatly increased its national importance. The first of these was the discovery of vast new supplies of gas in the South and Southwest. Many of these important discoveries were made in the search for oil by our friends in the petroleum industry who from the beginning have been closely associated with your business. The second was the development of greater economy in long distance transmission of gas through better trenching and pipelaying methods, and material advances in the art of pipe manufacture. Your industry has been fortunate in having the cooperation of steel manufacturers, with their extensive research facilities and aggressive management, for they have provided you with the facilities for gas transportation which have made the recent expansion possible.

Even with large known reserves and practical methods of transmission, the industry was not yet especially popular with investors because it was still considered somewhat speculative and money for the new long distance pipe lines was mostly obtained through the credit backing of parent utility and oil companies. Many of the great new long distance pipe lines reached completion during the worst of the Depression and some met with considerable financial difficulties. In spite of all the difficulties; either financial or those connected with warm winters or poor business conditions, markets have been obtained, the industry has established itself and in the past five years has reached the highest credit standing in its history.

Such is perhaps the conception of the average banker or investor of the development of the natural gas business to the position is occupies today.

Confidence in Natural Gas

We may ask ourselves what are the principal reasons for the present high credit position of the natural gas industry and what it is that makes the banker and bond buyer so willing to advance funds to this industry. I believe the answer is that in the first place the banker, the bond buyer and the consumer are thoroughly convinced of the value of natural gas as a fuel. In the second place they are convinced that adequate gas reserves exist and are available to the companies, in which they are interested and they realize that long distance transmis-
2515 sion of gas from these reserves to the large markets
is practical. In the third place the industry has been realistic in its attitude with respect to methods of financing, and finally the industry has had competent management.

I am sure that I was not invited here to preach a sermon, but it is a good opportunity to say one or two things that mean much to the banker, and I believe also to the industry.

First, past success should not mean the abandonment of sound standards of financing. Some 30% of this country's railroad mileage has gone into receivership, perhaps in part because debt was regarded more or less as a permanent fixture and not as something to be paid over a reasonable period of time. The natural gas industry should profit by the experience of other industries and be willing to devote a reasonable portion of its earnings to the retirement of debt.

The other thing that I wish to mention is expansion. No one is more desirous of adequate development of a natural resource than a banker. On the other hand, speaking only as a layman who doesn't have a fraction of the knowledge of you gentlemen as to where gas can be found I doubt whether the Almighty made gas reserves inexhaustible, and I wish to leave with you my hope that the enthusiasm of the industry for rapid development of its markets will not outrun the development of known reserves and that new pipe lines will not be built beyond the capacity of the known and securely available supplies of gas, for the sake of the investor, the consumer and the banker, about whom I was invited to talk.

In conclusion, it is my opinion that the natural gas industry has a most promising outlook. There is every reason to believe that with the continuation of its capable management, it will be a source of satisfactory profit to its stockholders and a leading utility in the communities which it serves, for many years to come.

2516. EXHIBIT NO. 173.

Gas—May 1939 37

A Stock Broker Analyzes The Natural Gas Industry

By John Nickerson III

Partner, Winslow & Douglas, New York City

In selecting a security for a customer, the investment analyst tries to answer two questions about the industry represented by the security. The first is "Has this industry a proper degree of permanency or security?"

In any investment program, the element of permanency is very important. Suppose a client purchases a security and it goes down in price. If the industry holds its own, theoretically at least, the security will eventually come back to or even surpass the price paid for it.

The second question is almost a corollary of the first, "Has the industry the ability to expand profitably?"

While the proverb, "An industry is born but to die," is subject to a good many interpretations, it is a good one to keep in mind. If an industry year after year loses its customers and increases its expenses, watch out, for however attractive its securities may seem because of high yield or other reasons, it is giving statistical signs of disappearing from the economic horizon.

With these two questions in mind let us look at the natural gas business. But before plunging into present day trends, we must begin at the beginning.

A Speculative Beginning

As we all know the natural gas business had its start amid hectic and wild speculations. The millions of cubic feet wasted through ignorance, through the fond belief that there was no end to the magic supply must cause operators of natural gas properties to grieve even today.

The bible says, "The sins of the father are visited on the children to the third and fourth generation." It is the memory of such profligacy which haunt the minds of the investing public today. As one banker said to me, "What happens when the gas is all gone? You can's spit through a pipe line."

I bring this up for the reason that in my opinion when the natural gas industry wishes to raise equity money through the sale of common stock, it will have to convince the public (1) that it is making every effort to conserve the gas, (2) that new discoveries of gas are more than keeping up with the consumption of gas.

Ralph E. Davis, an engineer high in the regard of the oil and gas business, writes in an article which appeared in Gas (June 1938):

"Some three years ago, I had an occasion to estimate the known gas reserves of this country and at that time placed the figure at 62 trillion cu. ft. A similar survey just completed has given a figure of 66 trillion ft. Thus it is seen that new discoveries of natural gas have been in excess of current deliveries and that taken as a whole the gas reserve position of the industry is quite secure."

On the subject of "gas conservation," N. G. McGowen, president of the United Gas Public Service Corp., stated before the Natural Gas Convention held at New Orleans in 1938:

"Conservation of our natural gas reserves and conservation in the production, transmission and utilization of natural gas has been faced positively by your gas association and the gas companies themselves, and the gas industry can pride itself on accomplishments in this regard during the past 10 years. We have encouraged sound conservation policies and have advocated sound conservation laws with proper enforcement. Realizing the importance of proper utilization of gas produced with oil, we recently have been supporting actively studies designed to permit the proper use, in an orderly manner, of more of the gas produced with oil, heretofore blown to the air and wasted."

The present day methods of operating a natural gas company as a producing, transporting and distributing unit may be said to have started in the early 1920's. Up to this time natural gas operations were essentially local situations and performed by many small corporations. This decade saw the formation of such corporations as Cities Service Co., Lone Star Gas Corp., Oklahoma Natural Gas Co., Interstate Gas Co. and others. At the same time the then existing corporations such as Columbia Gas & Electric Corp., Pacific Gas & Electric Co., Pacific Lighting Corp., expanded tremendously. In the South the Moody-Seagraves interests were rapidly building up what was to become the United Public Service Co. system. Certain of the oil companies (particularly Standard Oil of New Jersey) developed such properties as the Peoples Natural Gas Co. and the Hope Natural Gas Co. The year 1929 arrived with the natural gas companies expanding as fast as they physically could.

The year 1930 came and went with the country still hopeful that conditions of prosperity would return; 1931 came and went with hope beginning to go. With 1932 came a dull fear called depression that engulfed the country like a tidal wave.

What happened to this comparatively new industry called natural gas? Did it have that investment element called "permanency"? During a period of unprecedented deflation plus extraordinary rate cuts, only three important companies constituting about four per cent of the gross of the entire industry were forced to the wall.

At the Bottom, a Rise

From an operating standpoint even during this period of depression, the answer to our second question is given. In 1929 total customers using natural gas were 5,848,000. In 1932, the low point of the depression, total customers had risen to 6,082,000, an increase of 234,000.

If this business can increase during a time of deflation, it should increase during a period of comparative prosperity. And so it proved.

From 1932 to 1937 the number of customers had risen to 7,006,000, an increase of 924,000 or 15 per cent. During

this same period, gross revenues went from $340,000,000
to $441,000,000, an increase of nearly 30 per cent. Net
income rose from $43,000,000 to $74,000,000, an in-
2517 crease of 72 per cent. These figures make pleasant
music to an investor's ear.

But looking for the most part into holding company reports is a story of a development of an industry within an industry which is as amazing as any development occurring in the 1920's, namely, the high pressure, long distance natural gas transmission company. These companies sell only at wholesale to other utilities or to large industrial companies.

It appears as if the first bonafide wholesale long distance natural gas transmission line was the formation of the Colorado Interstate Gas Co. in 1927. This was for the purpose of transporting gas from Clayton, N. M. to Denver, Colo., a distance of 350 miles. In pick succession came Mississippi River Fuel Gas Co. (Louisiana to St. Louis—450 miles); El Paso Natural Gas Co. (Texas to Phoenix, Ariz.—200 miles); Southern Natural Gas (Louisiana to Macon, Ga.—462 miles); Natural Gas Pipe Line of America (Oklahoma to Illinois—950 miles); Northern Natural Gas Co. (Oklahoma to Minneapolis, Minn.—960 miles); Panhandle Eastern Pipe Line Co. (Texas to border of Indiana—850 miles).

By 1933 these long distance pipe lines were in full operation with the exception of Panhandle which had not yet tied in with Detroit. In this year the total gross revenues of the five leading long distance pipe lines was approximately $25,000,000 with a net loss of over $3,000,000. In 1937, the total gross revenues had risen to $57,000,000 with a net profit of $17,000,000.

Holding Companies Did It

It is a commentary on the times that the holding company which is the political scapegoat of the day quietly and unobtrusively financed and built a whole new industry during the depression, a time when jobs and money to finance them were as nuggets of gold.

This same political force which is relentlessly pursuing "big business" and other reasons such as necessity for additional financing, due to inevitable extension programs, will eventually oblige the transmission companies to look to the investing public for the necessary financing. The common stock of El Paso Natural Gas Co. and Southern Natural Gas Corp. are available in the security markets. Indirectly, Colorado Interstate Gas Co. and Natural Gas Pipe Line Co. of America (the Chicago line) may be purchased by buying Mission Oil Co. stock. In the same way an interest in Panhandle Eastern Pipe Line Co. may be acquired through Missouri-Kansas Pipe Line stock.

The year 1938 was a second test of the natural gas companies. On top of a spectacularly warm winter, industrial consumption was far from normal due to the inert year of 1938. But again the natural gas companies acquitted themselves very creditably. In nine important producing and distributing companies the gross income for the year 1938 was off six per cent and net income off 27 per cent. These two percentage figures are exaggerated because one of the companies which is included in the above tabulation gets a good percentage of its gross from the oil business which was very adversely hit during the past year.

Efficient Management

Examining the annual reports of the important companies, one is impressed that without exception, expenses are being held in line with gross income.

A good example of efficient management may be found in the 1938 annual report of the Peoples Gas, Light & Coke Co., an important distributor of natural gas:

"Operating expenses exclusive of the item of taxes, were $911,010 less than in 1937. Decreased expenditures for gas purchased and produced, due to reduced sales, accounted for the principal reduction in operating expenses. Unaccounted for losses were less both in volume and percentage send-out, than in 1931, and this was also partly responsible for the decreased expenditures for gas."

Another encouraging sign is that the managements are taking advantage of the current money market to refund all fixed income obligations on a more favorable basis wherever possible. Note may be made also of the attempt of some of the companies to space their bond maturities so that the whole funded debt may not fall due in any one year and also to provide for debt retirement by adequate sinking funds.

An interesting statement appears in the Lone Star Gas 1938 annual report:

"During the current year conditions surrounding the security markets were more favorable than in past years, and your directors decided that the best interest of stockholders would be served by refinancing all outstanding bonds, bank loan notes and preferred stocks of your corporation and subsidiary companies, provided new securities could be issued on a basis favorable to the Lone Star group. * * * Negotiations with underwriters and bankers indicated that new securities could be issued on a basis that would reduce the annual carrying charges, and provide for uniform maturities over a period of years, thereby avoiding the requirement of providing for peak maturities in later year."

Best of all, the customers of the natural gas companies are increasing. In practically every company, the rate of increase runs from three to five per cent over 1937. This fact indicates that the industry is alive and growing. It seems safe to assume that if the companies can get business during hard times, they can get a lot more business in good times with attendant profits to those that invest in their securities.

On this subject the annual report of the Oklahoma Natural Gas Co. states:

5

"Continuation of the construction of new homes is evidenced by the fact that the company has gained 5860 new customers during the year. * * * The addition of these new customers during the year and 16,182 during the past three years is a good indication of the stability and growth of the territory served."

A Look to the Future

Last, but not least, the annual reports of the different companies indicate that the managements realize the necessity of finding new supplies of gas and conserving those that they have. I quote from the 1938 annual report of the Pacific Lighting Co.:

"A deeper zone and extension were proved in the Kettleman North Dome field which is one of the most productive of the worlds known oil and gas supplies. Four new fields were discovered in the San Joaquin Valley, in one of which the discovery well was drilled to slightly over 15,000 ft.

bringing in the deepest zone in this area and opening up the possibility of new lower zones in existing valley fields. * * * It is estimated that of all gas produced in the state (California) in 1938, 90.3 per cent was delivered to pipe line systems serving gas customers, or utilized by oil and gas producing companies. This reflects an increase in unconserved gas due largely to the first flush production of new discoveries, and therefore may hoped to be temporary.''

No financial discussion, or in fact any treatise on any subject whether it be economic, social or political is complete without some pointed reference to the constant increase of taxes. I could give figures on the amount of gross and net consumed in taxes, but they have been
2518 read in a thousand places elsewhere.
If anyone, however, is curious enough to read an excellent analysis of the piercing, grinding, crunching, choking burden of taxes, which is bound to descend on this industry unless the present increase in taxes is stopped, I recommend he read the annual report of the Consolidated Edison Co. of New York. I am sure the company will send it to him on request.

To sum up, in my opinion the natural gas industry has given the lie to the oft-repeated statement that opportunity no longer knocks. It has answered in the affirmative the two questions which go through a stock broker's mind, namely, is the business permanent and is the business growing? From an investment point of view, ample yields are obtainable plus a large measure of possible appreciation for those investors who will study the securities of America's newest national industry, natural gas.

2519

EXHIBIT NO. 174.

The Gas Industry

Oldest Utility Gains New Vitality

With almost a century and a quarter of expansion and progress behind it, the gas industry in the United States has attained a new vitality in recent years and today occupies a strong position. In 1816, the first manufactured gas plant in this country was built in Baltimore, which then had a population of only about 56,000. Five years later, the first commercial natural gas well was drilled at Fredonia, N. Y., and natural gas was used there for lighting in 1824. Thus, both phases of the industry in the United States actually antedate the opening of the Erie Canal, while the electric lighting industry, beginning operations in 1882, is only about half as old as the gas industry.

During almost the first seventy years of its existence, the gas industry enjoyed practically unchallenged growth in the field of illumination. Then, in the early eighties, the electric light changed the character of competition in the lighting business from a struggle between two or more gas companies to one between industries. To meet the challenge offered by electricity, the gas companies first improved lighting equipment and service, and then set out to cultivate a new and previously untapped market, the use of gas for domestic cooking. So successful was this program that by the time electricity had seriously cut into the gas lighting load, the use of gas for domestic cooking, water heating and similar purposes had increased to such a degree that the trend of total gas sales continued to rise steadily. This capacity to adjust itself smoothly and effectively to changing conditions is still one of the salient characteristics of the gas industry, as has been demonstrated within the last ten years.

Group Effort Aids Sales

Shortly after the depression set in, according to the American Gas Association, leaders in the industry, noting that sales per domestic consumer were declining, determined upon a group effort to reverse this trend. Not only did the domestic business constitute more than 70 per cent of the industry's total sales, but, in the average company, from 80 to 85 per cent of the total investment had been made for the service of the domestic customer. From these figures the importance of this domestic business to the industry is evident. A study undertaken to discover the reasons for the decline in sales per domestic customer revealed that changes in the living habits of the American people had materially affected the use of gas in the home.

The study disclosed, for example, that while between 1910 and 1920 the number of American families increased by about 20 per cent, the number of restaurant keepers during the same period increased by more than 50 per cent, the volume of business of commercial laundries advanced by about 55 per cent, and the number of servants employed in homes and domestic establishments decreased by about 14 per cent.

2520 In addition, it was shown that from 1914 to 1925 the output of bread and other bakery products from commercial establishments rose more than 150 per cent, food prepared in commercial canning and preserving establishments nearly 180 per cent, and the preparation of foods in the so-called delicatessen category about 200 per cent.

In the field of building construction, it was found that whereas in 1921, 58 per cent of the families provided for in new buildings were to be housed in one-family dwellings, by 1927 this percentage had fallen to 38 per cent. During the same period, apartments or multi-family dwellings increased from 24 per cent of the total new construction to almost 50 per cent.

When these studies were made public in 1930, the gas industry was establishing new peaks in number of customers served, total sales, revenues and net income. Yet the leaders of the industry, as a result of the findings, decided on a program of action to anticipate and, as far as possible, turn to advantage the changes in the use of gas thus foreshadowed. In their program were reported aggressive merchandising and sales promotion activities, further study of the trends, and the formation of various committees for specific purposes.

Downward Trend Reversed

With the deepening of the depression, it became more apparent to the gas industry that it was being affected not only by the general economic conditions but also by the changes in public living habits affecting the use of gas in the home which continued, even after 1933, to exert a depressing influence. Consequently, merchandising and sales promotion activities were accelerated. In 1935, a national advertising campaign was inaugurated to bring forcibly to public attention "the numerous improvements that had been made in design and construction of gas appliances."

The establishment in 1924 of the American Gas Association Testing Laboratory, which tests more than 90 per cent of all makes of gas appliances sold in the United States and Canada, has made possible a steady and consistent increase by the laboratory in the basic national requirements for safety, durability and efficiency for its certification. Thus encouraged, improved performance of gas appliances has followed. Between 1927 and 1937, for instance, it is reported that the efficiency of the average gas range increased by some 15 per cent, and that of average gas water heaters rose by more than 30 per cent.

From 1929 through 1938, more than 11 million gas ranges were sold in this country, while sales of water heaters aggregated nearly six and one-half million, and gas refrigerator sales totaled 1,300,000. Last year alone, more than one million gas ranges were sold, and 740,000 new gas water heaters and approximately 185,000 new gas refrigerators were installed.

The progress achieved by the gas industry has been made against keen competition which has confronted it in practically all its fields of use. In most of the areas served by gas, the industry's advance has been accomplished despite the availability of coal, oil and electricity and of modern devices for their use. In brief, with the gas
2521 industry, as with other forms of private enterprise in the United States, competition has fostered progress.

Number of Customers Increases

Findings of a recently completed survey covering more than 104,000, or nearly 70 per cent, of the total number of one and two-family dwellings constructed in the United States last year show that use of gas for cooking was reported by 88 per cent, for water heating by 74 per cent, for house heating by 57 per cent, while 12 per cent reported the installation of new gas refrigerators.

A total of 17,135,000 customers, in 1938, an increase of 180,000 over the 1937 total, is the largest number ever served by manufactured and natural gas companies which supply towns and cities with a combined population of about 81,000,000. To provide service to these consumers, representing roughly three-fifths of all American households, requires a total investment in plants and equipment by the gas industry of almost $5,000,000,000.

According to preliminary estimates, revenues of the industry, including both natural and manufactured gas, amounted to about $786,576,000 in 1938, a decrease of 1.8 per cent from 1937. Sales of manufactured gas last year aggregated, it is estimated, $367,714,000, an increase of 2.2 per cent over 1937. Revenues of the natural gas companies totaled $418,862,000, a decrease of 5.1 per cent from the preceding year.

Total sales of manufactured gas for domestic uses, other than house heating, were reported at 198,331,000,000 cubic feet, a gain of 1.5 per cent for the year. House heating sales gained by about 10 per cent, even though mild temperatures prevailed throughout the year in most sections of the United States. Sales of natural gas for domestic uses, which, it is claimed, are substantially affected by weather conditions, decreased from 359,294,000,000 cubic feet in 1937 to 350,143,000,000 cubic feet in 1938, a loss of 2.5 per cent. Sales of manufactured gas for industrial and commercial purposes gained about 1.0 per cent, despite business stagnation, increasing from 107,433,000,000 cubic feet, in 1937, to 108,507,000,000 cubic feet, in 1938, but sales of natural gas for industrial and commercial purposes declined from 784,632,000,000 cubic feet, in 1937, to 680,910,000,000 cubic feet, in 1938, a loss of about 13 per cent.

Record Natural Gas Output

The total production of natural gas last year, including the amounts used in making carbon black and for field purposes[*] was estimated at the end of the year to constitute a new record output of more than two and one-half trillion cubic feet, approximately 2.0 per cent above the previous all-time peak reached in 1937. This was approximately six times the comparable figure for three decades earlier.

Known proven reserves of natural gas in this country are believed to amount to between 60 and 75 trillion cubic feet, or at the current rate of consumption to about
2522 25 to 30 years' supply. Authorities assert that continued exploration, improvement of drilling technique permitting penetration to greater depths and the search for petroleum are bound to uncover additional reserves of natural gas.

With more customers, greater total sales and larger revenues last year than in 1929, the natural gas industry has proved its vitality during the depression. The following table shows the progress of the industry in terms of number of customers, volume of sales, and revenues from sales during the period from 1929 through 1938.

---

[*] More than a trillion cubic feet of natural gas are sold annually in nonutility sales for such purposes as the cracking of gasoline, field sales, etc., and for the production of carbon black.

Manufactured Gas Gains.

Since the low point of the depression in 1933, the use of manufactured gas, like that of natural gas, has steadily increased, each year showing a gain in the number of customers and in the output. In only one year, 1935, during that period, was there a decline in the total revenues from sales. Comparative data regarding number of customers, output and revenues from sales in the period from 1929 to 1938 are given in the following table.

These figures present statistical evidence of the progress made by the manufactured gas industry in recent years, particularly in house heating and in industrial and commercial uses, where the advances, it will be noted, have been both steady and marked.

1938—Preliminary Estimates.
Source: American Gas Association.

Manufactured gas is derived chiefly from coal and it is estimated that at present rates of use the United States has a coal reserve that will last more than 4,000 years. Even if coal were used to supply nearly all the nation's energy requirements, the United States is believed to have a sufficient supply for more than 2,000 years. The manufacturing gas industry, therefore, is not confronted with the problem of reserve supplies.

Development of Markets.

The most widespread use of gas, of course, is in supplying heat for cooking. Improvement in the gas range has been one of the chief factors in the growth in use of gas in this field. An important market for gas, both natural and manufactured, appears to be in the field of house heating and attention has been paid in recent years to this market.

The improvement of equipment, reduced rates in many areas, together with sales campaigns, have helped materially to increase the consumption of gas in house heating through central plant burners and other heaters. It is estimated that a total of 825,000 gas central house heating installations were connected to the lines of all United States gas companies in 1938. Approximately 1,400,000 dwellings, it is claimed, are heated by unit heaters, space heaters, floor furnaces and similar equipment. Thus, the total number of homes in this country heated by gas is estimated at more than 2,225,000.

2524 Domestic water heating also offers great opportunities for increased sales of gas and this market is likewise being cultivated through nation-wide promotional activities and widespread adoption of more favorable rates as well as through improvements in equipment.

Adoption of an all-gas home program, with a competition for architects and for builders, demonstrations, and similar features, has been helpful in expanding sales through stimulating a wider selection of gas and gas appliances in building construction planning and specifications.

A three-year $1,500,000 national cooperative advertising campaign, financed by more than seven hundred gas and gas and electric companies, is credited not only with helping greatly to increase sales of gas itself, but with improving both the quantity and quality of advertising by appliance manufacturers and by local companies and dealers. The success of this advertising program is attested by the announcement of a three-year extension of the campaign to July, 1942.

Outlook for the Industry

With more customers than it has served at any time in its history, with greater sales and revenues than it enjoyed in 1929, and with the continuation of sales and promotional activities which have proved effective, the gas industry seems to have reason to face the future with confidence. Its soundness has been tested during the depression and it has demonstrated its stability and its capacity for growth.

In a difficult period the industry has succeeded in expanding its market both in domestic and in industrial uses. Through improvement of appliances it has made its product more acceptable to consumers. Confronted with changing business conditions and habits of living, the industry has shown itself flexible enough to take advantage of these changes to improve its position in a highly competitive field.

The growth of the gas industry and its record in adverse times, therefore, indicate that with any upturn in business generally it may be expected to achieve even greater advances than those already made in its century and a quarter of orderly progress.

The Fifth Big Job . . . Air Conditioning A Challenging Opportunity

By Charles R. Bellamy

Columbia Gas & Electric Corp., New York, N. Y. Chairman, Industrial and Commercial Air-Conditioning Committee.

A few years ago a great many people, including numerous industrial leaders, were expecting a new industry called summer air-conditioning to lead us right out of the depres-

---

Abstract of paper presented at annual convention, Natural Gas Section, American Gas Association, Tulsa, Okla., May 8-11, 1939.

sion. But it has not done so, and probably will not, because air-conditioning costs real money. In return it offers more comfortable and healthful living conditions, thereby raising the standard of living, but, as we all know, living standards are closely related to income, and when incomes are low, improvements of this nature are regarded as luxuries.

Gas Position Improves

Instead of a phenomenal growth it has had a steady growth, from a gross business of $10,000,000 in 1931 to an annual business variously estimated from $65,000,000 to $90,000,000. In 1938 when general business declined more than 20% and plumbing and heating dropped 16% from the year before air-conditioning decreased only 11%. This is significant of the industry's position today, and it is indeed fortunate from our standpoint that the growth of air-conditioning has been rather slow but sure, because every year has seen a market improvement in the competitive position of gas equipment.

In speaking of the summer air-conditioning market it is advisable to distinguish between the actual present market and the potential market. The size of the first is based upon present cost of air-conditioning and present business conditions, while the second is dependent upon lower costs and improved business conditions.

An Analysis of the Market

First let us frankly survey the present market. Undoubtedly the most promising and largest outlet at this time is in the commercial field. The thousands of installations in department stores, restaurants, theaters, and other commercial establishments have yielded such good returns to their investors that competitors must either fall in line or lose out entirely. For this reason every store, shop, theater, hotel, hospital, school and church is at the present time a potential customer. Less than 25% of the large department stores now have air-conditioning, and only about 10% of the larger restaurants. There are therefore over 3,000 department stores that are excellent prospects, and close to 19,000 restaurants. In addition to this there are thousands of shops, theaters and hotels which, sooner or later, must install summer air-conditioning.

The second best outlet at this writing is probably the industrial field. Here the possibilities of summer air-conditioning are just beginning to be appreciated. True, industrial air-conditioning is relatively old, but generally speaking these older installations were in factories and plants where control of temperature and humidity were obviously imperative. Now, however, the benefits of such control are being demonstrated in all kinds of industries, and the success of these new applications indicates a universal need of air-conditioning by industry.

At the present moment the actual available domestic market is probably only a fraction of the potential market. As the public becomes air-condition conscious, that is, acquainted not only with the comfort but also with the actual benefits of temperature and humidity control, and as general business picks up and equipment costs are lowered, the size of this market will expand. In this connection it is well to remember that every commercial and industrial installation has an educational value, and it is altogether possible that the popular demand for home air-conditioning will be accelerated by the completely air-conditioned automobile that is ready for marketing.

Large Business Predicted

Altogether the existing market for summer air-conditioning is large, and with the equipment costs reduced and operating performance improved this industry should soon do a gross business of over $100,000,000 per year. One large chemical company recently completed a survey of the air-conditioning market and reached the conclusion that this business should for some time continue to double every three years. One writer estimates a yearly gross of $350,000,000 sometime within the next ten years.

Just what percentage of this total business will go to gas it is impossible to say, but it should be a substantial amount. On the assumption that air-conditioning with gas will cost about $300 per ton of refrigeration effect, an annual gross business by gas equipment manufacturers of $100,000,000 would mean roughly 333,000 tons of new installation. Thus annual sales might readily develop a yearly gas load of approximately 9,300,000 M cu. ft. This should mean something like $5,000,000 of new business to the gas industry per year. In fact, one of our leading utilities, after a most thorough study, has set 10,-
2526 000,000 M cu. ft. of gas as the annual new possible
business of summer air-conditioning in this country.

Ourusoff,* in his comprehensive analysis of the residential market, found that this business alone might add around $2,260,000 of gross revenue per year for many years. Figure out what the cumulative effect of such additions would mean to our industry, and remember that every foot of such a load is off-peak business. Certainly, here is an opportunity worthy of the best efforts of our industry! It is indeed the ideal business for us.

In the light of past performance the figures which I have just given may appear optimistic, but ten years from now they may show up as a very conservative under-estimation. In any event, a large new market for fuel is opening up, and if the gas industry is to secure any appreciable portion of this market it must have confidence in its own product. Certainly vision, optimism and confidence are needed to plan our compaign; for faint heart never won fair lady.

New Capital Needed

Certain manufacturers have already spent large sums of money in developing processes and equipment; now new capital is needed to develop markets. Here is where the gas utility can step in and help. Gas air-conditioning equipment does not sell itself. It has to be sold. And I think our experience with house heating and refrigeration proves conclusively that successful merchandising of gas equipment requires the wholehearted backing of the local gas utility.

To put gas air-conditioning across, gas companies are going to have to participate with the manufacturers in a campaign of intelligent advertising and sound salesmanship. All this will cost money, but it should be money well spent for the summer air-conditioning load is the perfect supplement to our house heating business. At any given price for gas the air-conditioning load is far more attractive to the gas company than an equivalent volume of house heating business.

In the realm of general scientific research on the value of air-conditioning regardless of how achieved, recent developments have been most favorable to the cause of gas. As you all know, gas equipment lends itself peculiarly well to the control of humidity. In this connection the work of the American Society of Heating and Ventilating Engineers during the past summer on the physiological reactions of men while carrying on light work in atmospheric conditions including effective temperatures from 77° to 92° with relative humidities of 60%, 75% and 90% is very encouraging. Similar tests, using somewhat dryer air, would appear to be desirable, and it seems to me that the American Gas Association should encourage work of this nature.

---

* 1938 Report of Industrial and Commercial Air Conditioning Committee, Indutrial Gas Section, American Gas Association.

Tools Available Today

Now, let us examine carefully the air-conditioning tools that are available to the gas industry today:

Tool No. 1—The Gas Engine. Here is a tool especially suitable in certain locations for large commercial and industrial installations. The possibilities of expanding its field of application appear to be good.

Tool No. 2—The Dehumidifier. There are at least three well-designed gas-operated dehumidifiers on the market. Here is a tool that has been greatly improved during the past year and its cost reduced anywhere from 30% to 50%. Already favorably known in the air-conditioning business for its high-class performance, the dehumidifier, now more efficient and lower in cost than ever before, should have a correspondingly broader market. The modern dehumidifier with its cooling system can be used in many sections of our country to provide complete air-conditioning service of the highest order. Wherever refrigeration is imperative the low cost of the new models widens the market for split air-conditioning systems.

Tool No. 3—The Absorption Refrigeration Machine. There is one well designed machine now on the market and one or two others are expected to be put on commercial production some time this year. Here is a brand new tool, one that can do everything that the conventional electric unit does and more too, for here is the first machine to provide year-round air-conditioning.

Examine this array of tools critically and you will find that it constitutes a matched set of fine instruments. Each instrument has its own peculiar advantages and is unexcelled in certain fields of application. Collectively, these tools cover practically all requirements of air-conditioning, so that wherever natural gas is sold gas-operated air-conditioning equipment should forge to the front. There is high-grade, economical equipment for big installations, little installations, and for the most exacting specifications.

Let us not lose sight, however, of this one very important fact:—that while gas equipment is being perfected the manufacturers of electrical equipment are not standing still. Progress is being made on all fronts. Competition is extremely keen, and for some time gas is going to have to work very hard for every bit of air-conditioning business that it gets.

Practically all the equipment that the gas industry has been waiting for is now available and on the market. Since this is so, I believe that you will all agree that the time has come for the gas industry, especially those companies serving natural gas, to take an active part in the development of the air-conditioning business. A few companies already have crossed this Rubicon; but as yet there has been no united action.

Gas Company Program

Some companies are asking what should be done. Undoubtedly one of the first steps should be to air-condition gas company offices, as has been recommended by several of the A. G. A. committees. By so doing you not only make your customers comfortable, but give a practical demonstration of the value of true air-conditioning. I am glad to say that several of our progressive gas companies have already taken this step.

Another step that I believe all the larger companies should take is to establish an Air-Conditioning Department headed by a trained engineer. Regardless of the company's policies on appliance sales, this proposed department is needed to advise prospective buyers of air-conditioning systems and to see that gas equipment receives fair treatment in the various set-ups as submitted by local architects and contractors.

Possibly the greatest handicap that gas equipment
2527 has to face today is its lack of publicity and merchandising outlets. Local architects and contracting firms are, of course, much more familiar with conventional electric systems than with the newer gas units and need to be brought up to date and kept informed about the advantages of air-conditioning with gas. Here is one place where the gas company representative can do much pioneer and constructive work. In addition, I think that gas companies should make sizeable appropriations for advertising gas-

operated air-conditioning equipment, so that as public interest in air-conditioning is aroused there will be general recognition of the fact that gas is just as efficient for summer cooling as for winter heating.

Competitive Factors

If you should ask me when is the big market for air-conditioning going to open up, I should have to answer frankly that I don't know. In so far as the gas industry is concerned, it is my opinion that there are three main factors to be considered in any attempt to answer this question. The first is, Competitive Position of Available Equipment. Efficient, low cost and economical equipment is a prime requisite for new business. Since the above descriptive terms are used in their relative sense, we can say that factor No. 1 is at the present time favorable to a rapidly expanding business.

Factor No. 2 is concerned with merchandising methods and sales policy. Obviously, equipment manufacturers need the full co-operation of the gas industry. The need for an intensive and progressive sales campaign by gas companies and equipment manufacturers is urgent. The answer to factor No. 2 is largely in our own hands.

Factor No. 3 is concerned with the improvement in business conditions, which we are all hoping for. The new industry, air-conditioning, cannot by itself perform the impossible and correct all our economic ills, but by giving employment and by establishing higher living standards it can help business. Improved business will in turn stimulate the use of air-conditioning, and then, when good times return, if we have done our part, the summer demands for gas should grow by leaps and bounds.

2528 EXHIBIT NO. 178.

The Natural Gas Industry Provides Opportunities for Investment

By James S. Carroll

Statistician, Rauscher-Pierce & Company*

If any one industry of today were to be selected as one in which to confine the investment of funds, I would nominate the natural gas industry. This industry not only has had a very remarkable past, but has an extremely brilliant future.

---

* Reprinted from The Southwestern Banker, November, 1938.

Today approximately 1,500 gas companies in the United States supply gas to more than 8,000 cities, towns and villages having a total population in excess of 80,000,000—nearly two-thirds of the entire population of the United States. In 1937 the natural gas industry received from its 7,038,000 customers the sum of $441,232,000 for the almost incomprehensible figure of 1,314,493,000,000 cu. ft. of gas. To reach these customers with natural gas service required 179,670 miles of transmission and distribution lines. At the present there are 24 states in which natural gas is being produced and marketed in commercial quantities. These figures give a brief picture of the enormous size to which the natural gas industry has grown in its comparatively few years as a servant to mankind.

Industry's Enviable Record

The major portion of the growth of this industry has taken place during the past 10 to 15 years, during almost half of which period this country was experiencing one of the most serious business recessions in its history. That its growth and development took place despite these obstacles gives the industry an enviable record. Most business barometers of today indicate that business activity is below the level of 1926 (the year generally selected by statistical companies to indicate a normal year), and far below the peak reached in 1929. However, in 1937 sales for the natural gas industry not only were far in excess of those for 1926, but also had registered a 35 per cent increase over sales for 1929. At the close of 1937 the industry had about 20 per cent more customers than it had in 1929. Its actual history during the depression also affords an interesting study. Revenues for the industry registered their lowest figure in 1933, in which year they showed only a 13 per cent decrease from the 1929 level. However, in no year did the total number of active customers decrease below the level of 1929. Even in 1932, in which year the total number of active cutomers was at its lowest, this business still maintained a four per cent customer increase over 1929. Contrast these figures with the Standard Statistical Index of Industrial Activity, which figure dropped from around 108 in 1929 to about 54 in 1932—half its previous level. In other words, the natural gas industry not only showed considerably more progress than business generally during the period preceding and through 1929, but indicated a great deal more stability during the 1929-32 decline. After 1932, the industry immediately soared to new records.

There are several definite reasons for this phenomenal growth in the utility field. First and foremost, natural gas is cheap. Per B.t.u. of heat, it is cheaper than either manufactured gas, coal, or fuel oil. But even on an equal price basis, it is more economical for industries in that it requires no storage place which demands a tie-up of capital in fuel inventories. It is more easily handled than coal or oil. Since it requires practically no labor for handling, industries have turned to it in a time of mounting labor costs. Also, it is a much cleaner fuel and more efficient in that it leaves no residue and gives an even and easily controlled heat.

Looking at the industry from an investment standpoint, it has many exceptional features. A natural gas company requires only a small amount of labor, which is a particularly important item during inflationary times or business booms. For instance, where there is approximately one employee for every $3,000 invested in plant and machinery in the automobile industry and one employee for each $7000 investment in the steel business, there is one employee for each $37,000 investment in the gas industry. Consequently, labor problems as well as increasing labor costs are eliminated to a great extent. In addition, natural gas companies are not burdened with the problem of inventories. Inventory losses have had serious effects on many industries during business declines, and for this reason usually necessitate a large working capital position. Another safety factor of the natural gas business is that a municipality must have access to a proven and convenient gas field before it can begin any competitive efforts. In fact, to my knowledge, there has never been any actual instance where a municipality installed a competing natural gas system.

Prospects for Expansion.

Prospects for the continued expansion of the industry, both internally and externally, are highly favorable. The American Gas Association, Inc., estimates that there is a market for over 700,000 house-heating customers in the territory now served by natural gas, after making reasonable allowance for mild climate, low buying power, and other factors; also, a market for 625,000 gas refrigerators, after making allowance for buying power and present saturation of automatic refrigerators. With transmission lines 1,200 miles long having already been
2529 profitably constructed, the industry should have further growth into fields now served by manufactured gas and other fuels. Natural gas adds to the general welfare by supplanting higher cost and dirtier fuels and for this reason alone an expanding market appears to be inevitable. Also, the industry has perfected a gas light which in the future may prove to be a commercial attraction. In addition, the definite success of gas refrigerators indicates further use of this fuel in the air-conditioning industry.

The majority of natural gas companies have held their funded debt to conservative figures and have provided for large sinking funds. For this reason these securities have maintained a good record. This record is somewhat illustrated in the October, 1938, issue of the Natural Gas Industry, published by the American Gas Association, Inc. The association has compiled a detailed operating statement for the entire industry for each of the past seven years. This statement shows that in no year did the industry as a whole fail to earn its interest and amortization charges, after providing for depreciation, less than 1.43 times (in 1933), while the average for this seven-year period was a coverage of over twice. The average interest coverage for 1937 for the industry was 2.80 times. In a recent bulletin published by Standard Bond Investments there is a list of 342 defaulted bonds, which list includes all domestic corporate bonds carried in the service which are currently in default of either interest or principal. There are only two natural gas company bonds on this list, and one of these defaulted prior to the company's changing from manufactured to natural gas.

Undoubtedly, the natural gas industry has proved that it possesses a remarkable stability as well as tremendous future possibilities, and for this reason provides ~~the~~ investor with many attractive investment opportunities.

EXHIBIT NO. 179.

Annual Statistics of the Natural Gas Industry in 1938

(Cut)

American Gas Association
Statistical Bulletin No. 37
October, 1939

Paul Ryan, Chief Statistician
American Gas Association
420 Lexington Avenue New York City

2531

Foreword

The data shown in this bulletin present revised figures on the natural gas industry for the years 1929 to 1938, since companies formerly distributing manufactured gas but which were distributing natural gas at the beginning of 1938 have been included in the tabulation for all ten years. The tables therefore present a comparable and consistent picture of the operations of an identical group of companies over the ten year interval, and eliminate fictitious and misleading changes in customers, sales and revenues, etc., resulting from arbitrary reclassification of companies as natural gas or manufactured gas distributors in any particular year.

It should be noted that the line charts shown on top of pages 7, 9 and 11 are plotted on the logarithmic or ratio scale, and the charts therefore indicate percentage increase, facilitating direct comparisons between the slope of one curve and that of any other curve regardless of its location on the diagram. Such a chart compares percentage changes, while the arithmetic chart compares absolute changes.

Figures in these tables do not include natural gas used in field operations and in the manufacture of carbon black, or gas used by distributing companies in the conduct of their gas operations.

Companies selling mixed manufactured and natural gas are not included in these data.

---

* Companies formerly distributing manufactured gas but which were distributing natural gas at the beginning of 1938 have been included in the above tabulation for all eight years. The data shown above for 1931 to 1938 are therefore not comparable with data on the natural gas industry previously issued for those years.

** Includes leased property rents.

uted by the Board of Governor of the Federal Reserve System, and represent rates charged by reporting banks to their customers as distinguished from open market rates. All averages are based on rates reported for 3 types of customer ns - commercial loans, and demand and time loans on securities The method of computing the averages takes into account the relative importance of each of these 3 types of loans and (b) the relative importance of each reporting bank, as sured by total loans. In the 2 group averages the average rate for each city included is weighted according to the im- tance of that city in the group, as measured by the loans of all banks.

"high" shown for each year is the highest of the 12 monthly figures. The same explanation applies to the "low"

Arkansas Louisiana Gas Company

Arkansas Louisiana Gas Company is a subsidiary of Arkansas Natural Gas Corporation, a part of the Cities Service System. The Company produces, purchases, transmits, distributes and sells natural gas. Its operations are conducted in portions of Arkansas, Louisiana and Texas. The major portion of the Company's revenue is obtained from direct distribution of natural gas to residential, commercial, industrial and other customers in a few more than 100 communities in the three States. Among the larger cities served at retail are Little Rock, North Little Rock, Texarkana, Pine Bluff and Eldorado in Arkansas; Shreveport in Louisiana; and Texarkana in Texas. Natural gas is also sold at wholesale to Consumers Gas Company, an affiliate, for distribution in the City of Hot Springs, Arkansas. Natural gas is also sold at wholesale to other companies for distribution in certain small communities in Arkansas and Louisiana. The natural gas supply is obtained principally from fields located in Louisiana and Texas.

Financing in 1936.

In July of 1936 a public offering was made through underwriters of $10,000,000 principal amount of the Company's First Mortgage Bonds, 4% Series due July 1, 1951 and dated July 1, 1936. The price to the public was 98

exclusive of accrued interest. Underwriting commissions were 3% and incidental expenses were estimated at
2558 1.71% leaving net proceeds of 93.29% or $9,328,632.

After giving effect to sinking fund provisions, cost of money to the Company on the basis of such net proceeds was slightly under 5%.

The Company's financing in 1936 included also the delivery of $10,000,000 principal amount of 5% Debentures due July 1, 1952 to its parent company for the purpose of discharging in part certain obligations to the parent company.

Financing in 1939.

In September of 1939 announcement was made of the private sale of two new series of bonds and of the issuance of a new debenture issue, all to refund the 1936 financing. Specifically, the new securities were issued in the following amounts:

1. $3,300,000 of First Mortgage Bonds, Series A, 2¾%, dated Sept. 1, 1939 and due serially 1940 to 1944, sold to two New York Banks.
2. $9,700,000 of First Mortgage Bonds, Series B, 3¼%, dated Sept. 1, 1939 and due serially 1945 to 1954, sold to six insurance companies.
3. $6,500,000 of 4¼% Debentures due in 1955.

Proceeds from the sale of the two series of mortgage bonds were devoted to the retirement of:

1. $9,100,000 of First Mortgage 4% Bonds due July 1, 1951 representing the remaining amount outstanding of the original $10,000,000 issue of 1936.
2. $3,500,000 out of the $10,000,000 total of 5% Debentures issued in 1936 to Arkansas Natural Gas Corporation (parent company).

2559 The new $6,500,000 4¼% Debenture issue went to the parent company to discharge the balance of the $10,000,000 of 5% Debentures issued in 1936.

These three 1939 issues were all sold at par.

2560 Cities Service Gas Company.

Cities Service Gas Company is a subsidiary of Empire Gas & Fuel Company, a part of the Cities Service System. The Company operates approximately 4,300 miles of pipeline and sells gas to local distributing companies serving approximately 223 cities and communities, including Kansas City, St. Joseph, Springfield, Independence, Sedalia and Joplin, Missouri; Kansas City, Leavenworth, Atchison, Hutchinson, Ottawa, Topeka and Wichita, Kansas; and Bartlesville, Oklahoma.

In December of 1938 the Company sold privately to four banks and two insurance companies securities aggregating $35,000,000. This financing consisted of $20,000,000 of First Mortgage Pipeline 3¾% Bonds, scheduled to mature serially from March 20, 1947 to and including March 20, 1954, together with $15,000,000 of bank loans secured by an equal principal amount of First Pipeline Mortgage 3¼% Bonds scheduled to mature serially from March 20, 1940 to and including September 20, 1946.

Proceeds from this financing were used principally to retire $7,870,700 of Cities Service Gas Pipeline Company First Pipeline 6% Bonds due January 1, 1943 at 102 on February 28, 1939 and to retire $31,627,000 of Cities Service Gas Company First Pipeline 5½% Bonds due May 1, 1942 at 101 on February 28, 1939. Both of these refunded issues were obligations of Cities Service Gas Company.

2561 El Paso Natural Gas Company.

El Paso Natural Gas Company and its subsidiaries purchase natural gas from producers in the Lea County gas field in southeastern New Mexico, transmit it through a pipeline system and sell it at wholesale to public utilities and industrial customers located principally in or near El Paso, Texas; Douglas, Bisbee, Tucson, Superior and Phoenix, Arizona; and Cananea, Mexico. The pipeline system is in the neighborhood of 1,000 miles in length.

The derivation of operating revenue for the year 1938 was as follows:

Source	Amount	%
Public utilities including power plants	$2,264,666	46.0
Copper mining, smelting and refining	2,029,310	41.2
Other industrial	431,044	8.8
Gasoline, butane and propane	153,818	3.1
Crude oil and miscellaneous	45,062	0.9
	$4,923,900	100.0

Financing in 1936.

In June of 1936 a public offering was made through underwriters of $7,500,000 principal amount of First Mortgage Bonds, Series A, 4½%, due June 1, 1951 together with $3,750,000 of Convertible Debentures, 4¾%, due June 1, 1946. The bonds were offered to the public at 98½. After underwriting commissions of 3% and estimated incidental expenses of 1.35%, net proceeds were 94.15%, or $7,061,283.00 for the bonds. The convertible debentures were offered to the public at par. After underwriting commissions of 3½% and estimated incidental expenses of 1.35% net proceeds were 95.15%, or $3,568,142 for the 2562 convertible debentures. The cost of money on the bonds is estimated at somewhere between 5½% and 6% giving effect to the sinking fund requirements, but the cost has not been computed precisely because of inadequate information presently at hand with respect to the sinking fund. The cost of money for the debentures was 5.38% for the 10-year term. However, both of these issues were called for redemption (except that the debentures were almost entirely converted prior thereto) on January 16, 1939 pursuant to financing undertaken in December, 1938, which is discussed below.

By prospectus dated September 10, 1936, 60,000 shares of the Company's $3.00 par value common stock were offered at a price of $20.00 per share. However, this stock did not represent new financing inasmuch as the shares were already outstanding and were held by Clarence J. Shearn as Trustee under a declaration of trust of Engineer's Public Service Company, dated April 28, 1936.

Financing in 1937.

On October 1, 1937, the Company sold at private sale $1,200,000 of 4% First Mortgage Bonds, Series B, to four insurance companies at a price of 97¾ plus accrued interest. The proceeds were used to reimburse the treasury for part of construction costs previously expended. The bonds were dated June 1, 1937 and were to mature June 1, 1952. However, the issue was called for redemption at 102 on January 16, 1939 pursuant to the 1938 financing.

2562½ During 1937 the Company sold to its employees and officers other than the president 5,521 shares of common stock at $17.55 per share.

Financing in 1938.

In February, 1938, the Company borrowed from banks $600,000 on its notes scheduled to mature at the rate of $200,000 in two years and $400,000 in three years at an average interest rate of 3¼%.

On December 15, 1938, the Company negotiated a $4,000,000 loan from the Chase National Bank of the City of New York evidenced by 3% Serial Notes maturing semi-annually over a period of seven years from that date. On the same date the Company also sold privately $6,000,000 of 3½% First Mortgage Bonds to five insurance companies and an educational institution at a price of 98.5 net plus accrued interest. These Bonds are dated December 1, 1938 and mature December 1, 1935. A sinking fund begins on May 31, 1946 (in other words after the completion of the payment of the serial bank loan) and is calculated to retire the entire issue by maturity. Upon the basis of a net price of 98.5 for the 3½% Bonds, cost of money would be between 3.65% and 3.75% for maturities of from seven to fifteen years indicated by the terms of the sinking fund.

Proceeds from the December, 1938 financing were used in large part by the Company to call and retire all its notes and funded debt previously outstanding including the First Mortgage Series A and Series B Bonds, the 4¾% Convertible Debentures and the $600,000 of 2½% and 3½% Short Term Notes issued in February of 1938 as mentioned above. 2563 According to the Company's annual report to stockholders for the year 1938, this financing operation, in addition to retiring the short term notes, improved the Company's cash position by approximately $1,000,000. The report states also that all of the debentures were converted into common stock except two debentures presented by error after the time limit provided for conversion under the debenture agreement.

2564 Lone Star Gas Corporation and Lone Star Gas Company (A Subsidiary).

Lone Star Gas Corporation is a holding company, one of whose principal subsidiaries is Lone Star Gas Company. The Corporation also owns 30% of the capital stock of Northern Natural Gas Company.

The Lone Star System, which consists of the operating subsidiaries of the Corporation, produces, purchases, transmits and distributes natural gas in portions of Texas and Oklahoma and distributes natural gas (purchased from Northern Natural Gas Company) in Council Bluffs, Iowa. Natural gas is sold at retail in approximately 300 communities, including Dallas, Fort Worth, El Paso, Galveston, Waco, Wichita Falls, San Angelo and Abilene, Texas; and Council Bluffs, Iowa.

Lone Star Gas Company is engaged principally in the production and purchase of natural gas, the operation of a gas transmission system, and the sale of natural gas to System companies and to large industrial customers. It also serves Fort Worth and environs at retail.

Financing in 1936.

According to its annual report to stockholders the Corporation borrowed $2,900,000 "at satisfactory interest rates" to be repaid over a period of two and one-half years. Proceeds were used in connection with the redemption of 6% cumulative preference stock.

2565 Financing in 1937.

In August, 1937 the Corporation negotiated a $10,000,000 bank loan (Lone Star Gas Company concurrently negotiated a $6,000,000 bank loan). The banks and the amounts loaned by each are as follows:

$ 5,700,000	The Union Trust Company of Pittsburg.
2,500,000	The Chase National Bank of the City of New York.
1,000,000	The Mellon National Bank of Pittsburg.
600,000	The Farmers Deposit National Bank, Pittsburg.
200,000	The Union Savings Bank of Pittsburg.
$10,000,000	Total.

These notes are to mature in semi-annual installments aggregating $800,000 each from February 1, 1938 to and including February 1, 1942, and in a final installment of $2,800,000 on August 1, 1942. The notes are to bear interest at rates beginning at 1¾% for the first installment and increasing to 4% for the February 1st and August 1st, 1942 installments. The proceeds from these bank loans were used in connection with the redemption of $7,563,000 of Fifteen-Year 5% Debenture Gold Bonds due May 1, 1942, and the repayment of short term bank loans and notes.

In August of 1937 Lone Star Company negotiated bank loans in the amount of $6,000,000 as per the following schedules:

$3,420,000	The Union Trust Company of Pittsburg.
1,500,000	The Chase National Bank of the City of New York.
600,000	The Mellon National Bank of Pittsburg.
360,000	The Farmers Deposit National Bank, Pittsburg.
120,000	The Union Savings Bank of Pittsburg.
$6,000,000	Total.

The notes are to mature in semi-annual installments aggregating $450,000 each from February 1, 1938 to and including February 1, 1942, and in a final installment
2566 of $1,950,000 on August 1, 1942. The notes are to bear interest at rates beginning at 2% for the first installment and increasing to 4½% for the February 1st and August 1st, 1942 installments. The proceeds from these notes were used to discharge other bank loans and to effect a partial discharge of the Company's indebtedness to its parent company. A small amount was added to working capital.

Financing in 1938.

In August of 1938 a public offering was made through underwriters of $20,000,000 principal amount of the Corporation's Fifteen-Year 3½% Sinking Fund (Convertible) Debentures due August 1, 1953. At the same time, the Corporation negotiated bank loans in the amount of $11,300,000. Proceeds from this financing were used to retire the Corporation's 6½% Preferred Stock, retire all outstanding bank loans, and advance to subsidiary companies funds sufficient to retire bank loans and all outstanding bonds and preferred stock. Included among the retirements were all unmatured balances on the $16,000,000 of bank loans effected in 1937 as hereinabove described.

The Debentures were offered to the public at 102. After underwriting commissions of 2% and estimated incidental expenses of 0.64%, net proceeds were 99.36% or $19,871,440. The rate of cost of such net proceeds is 3.63%, giving effect to the sinking fund.

The $11,300,000 of bank loans carry interest at 2⅞% per
annum and mature as follows: $1,000,000 semi-annually
from February 1, 1939 to August 1, 1942, inclusive,
2567 and $550,000 semi-annually from February 1, 1943
to August 1, 1945, inclusive. The banks and the
amounts loaned by each are:

$ 6,780,000	The Union Trust Company of Pittsburg.
2,486,000	The Chase National Bank of the City of New York.
1,356,000	The Mellon National Bank of Pittsburg.
678,000	The Farmers Deposit National Bank, Pittsburg.
$11,300,000	Total.

Reduction of Interest Rate on Bank Loan.

In September of 1939 the Securities and Exchange Commission approved a reduction from 2⅞% to 2⅜% in the rate of interest on the bank loan made in 1938 as described above. Although the loan was originally for $11,300,000, the reduction in the interest rate applied only to $8,750,000 since the $1,000,000 maturity of February 1, 1939, the like maturity of August 1, 1939 and the $550,000 maturity of August 1, 1945 were paid prior to the change in the interest rate. Interest savings of $116,728 were effected by the change. No changes other than the interest rate were made in the bank loan.

2568 Mississippi River Fuel Corporation.

Mississippi River Fuel Corporation owns and operates approximately 450 miles of main pipeline with a capacity of 100,000,000 cubic feet of gas per day extending from the Richland and Monroe gas fields in northern Louisiana to the city of St. Louis, Missouri, and nearby points in Illinois. The Corporation's supply of natural gas is secured by contracts with producers in the Louisiana fields including Interstate Natural Gas Company, Inc., and Hope Producing Company. The Corporation sells at wholesale to the Laclede Gas Light Company which distributes gas in St. Louis and to Cahokia Manufacturing Gas Company. It also has contracts for the delivery of gas directly to industrial customers.

Early in 1937, the Corporation sold privately $10,000,-

000 of 4% First Mortgage Pipeline Bonds dated February 1, 1937 and due February 1, 1952. Proceeds were used for the redemption of approximately $9,482,000 of First Mortgage 6% Bonds due in 1944 at 105 on February 15, 1937.

The majority of the Corporation's Common stock is owned by a syndicate which includes Standard Oil Company (New Jersey), United Gas Corporation, Columbian Carbon Company and United Carbon Company.

2569 Northern Natural Gas Company.

Northern Natural Gas Company owns and operates a natural gas pipeline system, together with its subsidiaries, which produces, gathers, transmits and distributes natural gas. The line is approximately 2,000 miles long and extends from the Texas Panhandle and the Hugoton, Kansas, gas fields to South Dakota and Minnesota. The gas is sold at wholesale in Iowa, Kansas, Nebraska, South Dakota and Minnesota. Among the cities supplied are Omaha, Lincoln, Council Bluffs, Des Moines, Sioux City, Minneapolis and Rochester. The supply of natural gas is obtained largely through purchase contracts with producing companies but considerable acreage of proved leases and a number of producing wells are owned.

The Company's common stock is owned as follows:

30% by Lone Star Gas Corporation,
35% by North American Light & Power Company, and
35% by United Light & Railways Company.

Published reports indicate that during recent years prior to 1939 the Company has sold privately the following securities:

1. $16,000,000 of First Mortgage and First Lien Bonds, Series A, 4¾%, due July 1, 1947.
2. $2,000,000 of First Mortgage and First Lien Bonds, Series B, 4¼%, due July 1, 1947.
3. $3,000,000 of 4½% Debentures, dated July 1, 1938, due July 1, 1948.

No further details are available with respect to the foregoing financing.

2570 Financing in 1939.

The Company sold privately at par $16,000,000 principal amount of First Mortgage and First Lien, Series A, 3¼% Bonds due July 1, 1954 to five insurance companies.

A fee of one-half of one per cent was paid to a banking house for negotiating the sale.

Proceeds from the sale of the new bonds were applied toward the redemption of all previously outstanding funded debt, namely the Series A and B bonds and the 4½% debentures listed above (but in principal amounts reduced from those shown above).

Concurrently with the bond issue, the Company negotiated a bank loan of $6,000,000 at 2⅛%, maturing $500,000 on July 1, 1940 and semi-annually thereafter to and including January 1, 1946. Proceeds from this loan were to be applied as follows:

$3,600,000 for construction of approximately 240 miles of 16 inch transmission line from Sioux City, Iowa, to a point near Minneapolis, Minnesota.

$1,200,000 for compressor station property, laterals, etc.

Balance to defray cost of additions and improvements of present property.

Oklahoma Natural Gas Company purchases, produces (to a minor extent), distributes and sells natural gas at wholesale and retail. Production properties, transmission lines and distribution systems in Oklahoma constitute the major portion of the system but the Company also has two small groups of properties in Kansas which are not physically connected with the Oklahoma system. Among the principal communities served at retail are Tulsa and Oklahoma City. A small amount of revenue is derived from sales at wholesale at city gates. The Company purchases the major portion of its requirements from producers operating in a number of small fields throughout Oklahoma and principally in the general area around Tulsa and Oklahoma City. The system includes approximately 2200 miles of transmission lines and 1900 miles of distribution lines.

Financing in 1936.

In June of 1936 a public offering was made through underwriters of $20,000,000 principal amount of First Mortgage Bonds Series A, 4½% due May 1, 1951 and $10,000,000 principal amount of 5% Convertible Debentures due May 1, 1946.

The bonds were offered to the public at 98½. After underwriters' commissions of 3% and estimated incidental expenses of 0.66%, net proceeds were 94.84% or $18,967,087. The rate of cost for such net proceeds is 5.61% giving effect to the sinking fund requirements.

2572 The debentures were offered to the public at 100. After underwriters' commissions of 3½% and estimated incidental expenses of 0.66%, net proceeds were 95.84% or $9,583,543. The rate of cost for such net proceeds is 5.55%.

In October of 1936 a public offering was made of 22,200 shares of Convertible 6% Prior Preference Stock of $100 par value per share. The stock was offered to the public at $100 per share and underwriting commissions were $4.00 per share. Strictly speaking, the offering of these shares did not represent new financing inasmuch as the shares had been delivered to Gas Utilities Company on June 17, 1936 in exchange for $2,220,000 principal amount of 5% Serial Notes, Series B, due serially from November 1, 1936 to November 1, 1951 (such notes were those of Oklahoma Natural Gas Company who cancelled them upon receiving them pursuant to this exchange). The public offering in October of 1936 was thus made by the underwriters who received the stock from Gas Utilities Company, who in turn distributed the proceeds to its stockholders.

Pursuant to financing undertaken in 1939, as described below, all the securities involved in this 1936 financing were retired in 1939 insofar as amounts were then outstanding. Specifically, the redemptions were as follows:

1. Entire outstanding issue of First Mortgage Bonds, Series A, 4½%, due May 1, 1951, called for redemption at 105 on September 22, 1939.
2. Entire issue of 5% Convertible Debentures due May 1, 1946, called for redemption at 110 on October 7, 1939.
3. Entire issue of 6% Cumulative Convertible Prior Preference Stock called for redemption at $110 per share on October 2, 1939.

2573 Financing in 1939.

By prospectus dated August 17, 1939 the following securities of the Company were publicly offered through underwriters:

1. $17,000,000 principal amount of First Mortgage Bonds, Series B, 3¾%, due August 1, 1955 at 103½.
2. 58,000 shares of $5.50 Convertible Prior Preferred

stock (no par value; stated value $100.00 per share) with cumulative dividends at $104.00 per share.

The proceeds of this financing together with proceeds from an $8,000,000 bank loan, hereinafter described, were applied largely toward the redemption of the 1936 financing as already noted.

The new Series B bonds were offered at 103½ to yield 3.46% to the August 1, 1955 maturity date. After underwriting commissions (2%) and estimated incidental expenses ($0.55), net proceeds were $17,160,965 or 100.95% of par. The cost of these net proceeds is approximately 3.82% giving effect to sinking fund retirements, but not to call premiums and expenses on the retired 1936 issue, which premiums and expenses have not been deducted from the net proceeds here mentioned.

The new preferred stock was offered at $104.00 per share to yield 5.29%. Underwriting commissions of $3.00 per share and estimated incidental expenses of $0.49 per share left net proceeds of $100.51 per share. The dividend rate of $5.50 per share represents a cost of 5.47% on these net proceeds.

Simultaneously with the sale of the new bonds and stock the Company proposed to issue its unsecured promissory notes to banks evidencing a loan of $8,000,000 in the aggregate. The amount of the loan is subject to re-
2574 duction to the extent that conversion of the 1936 is-
sues prior to redemption reduces the need for funds for such redemption. The notes bear interest at 2.19% to April 1, 1940 and thereafter at 2.75%. The loan is scheduled to mature as follows, assuming a maximum loan of $8,000,000:

Amount	Date Due
$1,500,000	4-1-41
1,100,000	4-1-42

2575 Panhandle Eastern Pipe Line Company.

Panhandle Eastern Pipe Line Company, directly and through subsidiaries, produces, purchases, transmits and sells natural gas.

Panhandle Eastern Pipe Line Company operates a natural gas transmission line from the Amarillo gas field in the Texas Panhandle through the States of Oklahoma, Kansas, Missouri and Illinois to a point in Indiana near Dana, adjacent to the Illinois-Indiana State line. The major portion of gas transmitted is sold to distributing companies and other transmission companies for resale. Almost all of the balance is sold to industrial customers.

Among the principal distributing utilities obtaining gas from the Panhandle Eastern system are Central Illinois Electric and Gas Company, Central Illinois Light Company, Central Illinois Public Service Company, Illinois Iowa Power Company, Missouri Power & Light Company and Michigan Consolidated Gas Company (formerly Detroit City Gas Company). The supply for the last named company is transported from Panhandle's line to Detroit by Michigan Gas Transmission Corporation.

In March, 1937, a public offering was made through underwriters of $24,000,000 principal amount of First Mortgage and First Lien Bonds, Series A, 4% due March 1, 1952. The bonds were offered to the public at 97.50. After underwriting commissions of 2% and estimated incidental
expenses of 0.48%, net proceeds were 95.02% or $22,-
2576 805,528 for the issue. The rate of cost of such net
proceeds is 4.68%, giving effect to sinking fund requirements.

During 1937 the Company obtained bank loans of approximately $5,000,000, of which $2,000,000 was converted into 2½% notes due June 15, 1939.

Receivers of Missouri-Kansas Pipe Line Company held a transferable warrant evidencing the right to subscribe for 80,000 shares of Panhandle Eastern Pipe Line Company common stock at $25.00 per share. Pursuant to court order these rights were distributed in 1939 to holders of the stocks of Missouri-Kansas Pipe Line Company. This offering was covered by a prospectus dated July 29, 1939.

Columbia Oil and Gasoline Corporation by contract dated January 31, 1936 agreed with Panhandle Eastern Pipe Line Company, et al., to purchase at $25.00 per share any of the 80,000 shares not subscribed or purchased by exercise of the rights.

Net proceeds from the sale of the stock, estimated at $1,918,600 after expenses, were to be used to reimburse the treasury for part of expenditures made in 1936.

2577

Southern Natural Gas Company.

Southern Natural Gas Company (successor in reorganization to Southern Natural Gas Corporation) operates a natural gas pipeline system from the Monroe, Louisiana, gas field across Mississippi and Alabama and into Georgia. Gas is sold to distributing companies in these States and to a few industrial customers. Among the communities served by the distributing companies are Atlanta, Columbus, Decatur, Macon and Rome, Georgia; Anniston, Gadsden, Montgomery and Tuscaloosa, Alabama; and Columbus, Meridian and Vicksburg, Mississippi.

Financing in 1936.

In November of 1936 a public offering was made through underwriters of $15,000,000 principal amount of First Mortgage Pipe Line Sinking Fund Bonds 4½%, due October 1, 1951. The bonds were offered to the public at par. After underwriting commissions of 2½% and estimated incidental expenses of 1.21%, net proceeds were 96.29% or $14,444,000. The cost of such net proceeds is 5.13% giving effect to sinking fund requirements.

Financing in 1937.

In connection with the acquisition of Alabama Gas Company, the Company secured a bank loan in the amount of $2,000,000 of which $175,000 was repaid December 1, 1937, the balance to mature in installments of $175,000 on each June 1st and December 1st to and including December 1, 1939 and the final installment of $1,125,000 on June 1,
2578 1940. This loan carries interest at the rate of 4½% and was made by the New York Trust Company, New York.

In December, 1937 the Company sold to an insurance company $650,000 of a new series of its First Mortgage Pipeline Sinking Fund Bonds at 97¾ plus accrued interest. The bonds bear interest at 4½% and mature April 1, 1952. The proceeds were used to finance in part additional compressing facilities constructed during the year. A sinking fund is provided for the retirement of the bonds in approximately equal annual installments commencing in 1938.

Financing in 1939.

On March 10, 1939 the Company repaid to The New York Trust Company the balance of $1,475,000 due on the 4½% loan obtained in 1937 (see above). On the same date, the Company issued a 4½% collateral note for $900,000 to The First National Bank of Birmingham, Alabama. Proceeds from this new loan and treasury funds were used to repay the 1937 loan. The new loan is payable as follows:

$100,000 semi-annually on December 31, 1939, June 30th and December 31, 1940.

$150,000 on June 30 and December 31, 1941, and June 30th and December 31, 1942.

In October of 1939 the Company filed a declaration with the Securities and Exchange Commission in regard to the proposed reduction of the interest rate on the $900,000 loan from 4½% to 4%. The Company stated that the holder of the note has agreed to the reduction. Hearing has been set for October 13, 1939.

2579 Southwestern Development Company.

Southwestern Development Company is a holding company organized under the laws of Colorado in 1924. The Company owns 100% of the common stock of subsidiaries engaged in the production, transportation and/or distribution of natural gas for resale or sale to domestic, commercial and industrial customers in Texas and New Mexico. One of the most important communities served is Amarillo, Texas.

The Company also has the following interests:

42.50%	in Colorado Interstate Gas Company
26.62%	in Texoma Natural Gas Company
13.31%	in Natural Gas Pipeline Company of America
100.00%	in Canadian River Gas Company.

Mission Oil Company owns approximately 47% and Consolidated Oil Corporation owns about 51% of the stock of Southwestern Development Company.

Financing in 1936.

Pursuant to a loan agreement with Guaranty Trust Company of New York dated July 1, 1936 the Company issues its promissory notes to the bank in the amount of $6,376,348.36 to cover indebtedness of the same amount owing to the bank. The maturities and annual interest rates on this loan were:

Amount	Date Due	Interest Rate
$ 750,000.00	7-1-37	2%
750,000.00	7-1-38	2½%
750,000.00	7-1-39	3%
750,000.00	7-1-40	3½%
3,376,348.36	7-1-41	4%
$6,376,348.36		

2580 The Company also issued unsecured 4% notes due July 1, 1942 in the amount of $1,762,003.08 to common stockholders in payment of dividends. These notes were subsequently redeemed.

Financing in 1937.

A loan agreement with the same New York bank dated September 23, 1937 covered a 4% loan in the following particulars:

Amount	Date Due
$ 300,000.00	1-2-39
300,000.00	1-2-40
300,000.00	1-2-41
300,000.00	1-2-42
2,092,000.00	1-2-43
$3,292,000.00	

The proceeds were used to acquire $3,292,000 principal amount of South Plains Gas Company First Mortgage and Collateral Trust 6% Bonds due January 1, 1945. The Company acquired $150,000 of these bonds from Amarillo Gas Company and the balance from Consolidated Oil Corporation.

In 1937 the Company also issued $2,040,300 of unsecured 4% notes maturing July 1, 1943 in payment of a dividend on its common stock.

Financing in 1939.

An amendment of the July 1, 1936 loan agreement was entered into as of July 1, 1939 whereby the July 1, 1941 maturity of the July 1, 1936 loan agreement was largely extended and the interest rate reduced from 4% to 3½%. New maturities were:

2581

Amount	Date Due
$ 600,000.00	7-1-41
600,000.00	7-1-42
600,000.00	7-1-43
762,298.36	7-1-44
$2,562,298.36	

A third loan agreement was entered into with the same bank providing for the issuance of two notes, as follows:

1. A 3% collateral note in the amount of $2,921,784.46 dated August 1, 1939 to mature:

$ 359,486.10	on	7-1-40
600,000.00	on	7-1-41
600,000.00	on	7-1-42
600,000.00	on	7-1-43
762,298.36	on	7-1-44
$2,921,784.46		

This note was issued to refund a note of the same amount representing the balance due under the July 1, 1936 loan agreement as amended July 1, 1939.

2. A 3% collateral note in the amount of $4,962,084.46 to be dated on or before January 2, 1940 and to mature:

$ 359,486.10	on	7-1-40
750,000.00	on	7-1-41
750,000.00	on	7-1-42
750,000.00	on	7-1-43
750,000.00	on	7-1-44
1,602,598.36	on	7-1-45
$4,962,084.46		

This note will refund the unpaid balance of the $2,921,784.46 on the note dated August 1, 1939 (item No. 1 above) and will provide funds for the redemption of the $2,040,300 of dividend notes due July 1, 1943, to be redeemed in full on January 2, 1940.

A balance of $2,751,340 under the September 23, 2582 1937 loan agreement was paid. Funds for this purpose were secured by selling $3,150,000 principal amount of South Plains Gas Company 6% bonds (see 1937 financing re acquisition of these bonds) to West Texas Gas Company. (West Texas Gas Company had assumed these bonds in connection with its acquisition of South Plains Gas Company.) West Texas Gas Company obtained funds for purchase of these bonds by issuance of a note to the New York bank in the amount of $3,150,000 under a loan agreement of August, 1939. The note bears interest at 3% and matures $150,000 semi-annually on January 2 and July 1 beginning January 2, 1940 and continuing until January 1, 1945 when the balance of $1,650,000 becomes due. The South Plains Gas Company bonds were pledged as collateral after reducting the interest rate thereon from 6% to 3% and amending the sinking fund to conform with the note installments.

Amarillo Gas Company, a subsidiary of the Company, had borrowed $450,000 for refunding purposes from the same bank in 1937 by issuance of a 4% note dated August 1, 1937 and maturing serially July 1, 1938 to 1941. The note was guaranteed by the Company. A balance of $270,000 on this loan was refunded in 1939 by supplemental loan agreement dated August 1, 1939 covering a new 3% note maturing:

$50,000	on	July 1, 1940
50,000	on	July 1, 1941
50,000	on	July 1, 1942
50,000	on	July 1, 1943
70,000	on	July 1, 1944
$270,000

Detail of Annual Expense

Single Line

Operation of Wells and Gathering Lines

A. Operation of Wells—Average per year—

Rent and building operation	$ 8,000	
Production Department	60,000	
Accounting	14,000	
Legal, including lawsuits & retainers	18,000	
Purchasing and stores	21,000	
Engineering Department	23,000	
Geological Department	34,000	
Land and Lease	14,000	
Maintenance of Wells	160,000	
Damages, injuries & Workmen's Compensation	8,000	
Taxes and Insurance	67,000	
Supplies	8,000	
Total		$435,000

B. Operation of Gathering Lines:

First Year—Pipelines and Compressor Stations—

Superintendent District Supts. Line Walkers Meter Men Clerks	20 men	$ 37,500	
Supplies and Car Expense		12,500	
Total First Year			$ 50,000

Fifteenth Year—

Pipelines

Superintendent Dist. Supts. Line Walkers Meter Men Clerks	26 men	$ 50,400
Supplies and Car Expense		17,000
Total (Pipelines)		$ 67,400

2600 Booster Stations			
Superintendents)			
Station Engineers)	36 men	$ 72,000	
Oilers)			
Cylinder oil and operation supplies		10,600	
Total (Booster Stations)		$82,600	
Total Fifteenth Year			$150,000
Average Annual Cost of operating Gathering Lines			100,000
Total Cost of Operation of Wells and Gathering Lines			535,000

2601 Rentals, Renewals, in Lieu Payments, Dry Hole Expenses and Royalties

Rentals	$ 56,000	
Renewals	35,000	
In lieu payments	12,000	
Dry Hole expenses	32,000	
Royalties	176,000	
Total		$311,000

2602 Maintenance of Gathering Lines

A. First Year 1½% x $4,589,000 = $ 69,000
B. 15th year 1½% x $7,109,000 = 107,000
C. Average for 15 years = 88,000

2603 Operation and Maintenance of Gasoline Plant

Operation labor	$ 40,000	
Operating supplies	20,000	
Fuel, Water, and Power	66,000	
Maintenance 2½%	19,000	
Tank Car Rental	30,000	
Brokerage	30,000	
Undistributed & unforeseen	45,000	
Total		$250,000

2604 Cost of Gas Purchased

Cost of gas at 6¢ per MCF—			$798,000
Add: Proportion of Net Revenue from Sale of Gasoline—			
Gross Revenue from Sale of Gasoline		$630,000	
Expense of Operating Gasoline Plant:			
Operating Expense	$250,000		
Amortization	51,000		
Interest	45,000		
Total Expense		346,000	
Net Revenue		$284,000	
¼ of Net Revenue to be paid for gas purchased, in addition to payments at rate of 6¢ per MCF—			71,000
Total Cost of Gas Purchased—			$869,000

2605 Operation and Maintenance of Compressor Stations

Operation of Compressor Stations			
Station Supts. Main Engineers Auxiliary Engineers Utility Men	80 men	$162,000	
Oilers (66 men)		118,800	
Cylinder oil & Operating Supplies		71,200	
Total			$352,000
Maintenance of Compressor Stations 2½% of $10,538,314 =			$263,000

2606 Operation of Main Line

Item	
Superintendents (14 men)	$36,000
Line Walkers (45 men)	67,500
Meter Station Employees (16 men)	27,900
Warehouse Employees (10 men)	18,000
Telephone Employees (13 men)	26,000
Rental for Leased Telephone Equipment	5,000
Automobile Expense	30,000
Sundry Supplies and Expense	27,600
Total	$238,000

2607 Maintenance of Main Pipe Line and Telephone System

1½% of $39,069,809 = $585,000.

(Above investment includes main pipeline, telephone system, interest during construction, and overhead)

2608 Insurance and Taxes

1½% of $55,977,123 ≑ $840,000

(Above investment includes pipeline, compressor stations, telephone, gathering system, interest during construction, and overhead).

2609 Administrative and other General Expenses

Salaries and wages (100 persons)	$380,000
Traveling expense	100,000
Automobile expense of administrative personnel, including depreciation	60,000
Rent	45,000
Legal Expense, including retainers	80,000
Personal liability insurance, injuries and damages	50,000
Telephone and telegraph	25,000
Stationery and printing	30,000
Miscellaneous	30,000
Total	$800,000

2610 Amortization of Cost of Gas Leases and Wells

A. Gas leases were amortized at the rate of 4.3% per year which is on the basis of a 15-year sinking fund with interest compounded annually at 6%. The investment involved is $15,429,768 and the annual expense is $665,000.

B. Gas wells were all amortized by the end of the 15-year period. Wells drilled or purchased in the first year were amortized in 15 years on the sinking fund basis. Wells drilled in the 10th year were amortized in 5 years. Thus this charge varies from year to year but averages $472,000.

2611 Amortization of Investment in Gathering Lines

Total investment amortized during the fifteen year period of operation. The amount spent the first year was amortized in 15 years, on the sinking fund method compounding the interest annually at 6%. The amount spent in the 5th year was amortized in 10 years, etc. The investment changes from $4,589,000 in the first year to $7,109,000 in the fifteenth.

2612 Amortization of Investment in Gasofine Plant

This plant was amortized in 10 years, assuming a net salvage value at the end of that time of 10%. Thus the amortization rate on this plant was computed at 7.6% per year on 90% of the investment. This gives $51,000 per year.

2613 Amortization of Main Line and Compressor Stations

This was computed on a fifteen year sinking fund basis compounding the interest annually at 6%. This gives an amortization rate of 4.3% per year which is applicable to $49,608,123, resulting in an annual figure of $2,140,000.

(Above investment includes pipeline, telephone, compressor stations, interest during construction, and overhead).

2614 Continental Construction Corporation Stock

Amount paid in for the 1,000 outstanding shares of Continental Construction Corporation stock............. $100,000.00

2615 Cost of Drilling Wells in Texas Panhandle

Wheeler County	$20,000
Gray County	25,000
Hutchinson County	25,000
Moore County	30,000

2616 Detail of Auto Expense

Average number of cars needed at one time	120	
Length of construction period	18 months	
Total number of car months	2,160	
Average useful life in months	10	
Total number of cars needed	216	
Cost Per Car For Average Life		
Average cost of car equipped	$800	
Re-sale value at end of useful period	200	
Writeoff per car		$ 600

10 Months Expense per car

Interest	$ 53	
Gasoline	400	
Oil	130	
Greasing	70	
Washing	52	
Repairs	165	
Storage	150	
License	15	
Insurance	25	
Tires	35	
		1,095
Total writeoff and expense per car		$ 1,695

Total Auto Expense 216 cars at $1,695	$366,000

2617

Detail of Miscellaneous Expense

Note: The following are the major items in the estimate of $593,966 for miscellaneous expense.

1.	Road Markers and Signs	$ 15,000
2.	Fence Step-Overs	10,000
3.	Bridges for Line Walkers	100,000
4.	Pipe Racks	20,000
5.	Sleeve Boxes	5,000
6.	Rock, Sandbags & Brush to stop washing	100,000
7.	Cattle Guards	25,000
8.	Auxiliary River Crossings	250,000

1. Gas pipeline crossing markers are being installed at county and state highway crossings. Various signs are being erected at river crossings and other vital points.

2. In certain districts, woven wire fences make it essential that fence step-overs be installed so line walkers may follow the line.

3. Bridges for line walkers will be required across certain streams to facilitate operations.

4 & 5. Racks and boxes are being erected at frequent intervals to store pipe and emergency sleeves.

6. As the backfill seasons, additional protection is being provided at points subject to erosion.

7. The line crosses large ranches where it is necessary to cut fences and install cattle guards due to lack of roads.

8. Additional river crossing capacity is yet to be provided.

STATE OF ILLINOIS

ILLINOIS COMMERCE COMMISSION

CERTIFICATE

The Peoples Gas Light and Coke Co.
Re: In the matter of proposed change in rates for gas service in Chicago, as stated in Rate Schedule Ill. C. C. No. 14 } 21170

I, Joseph E. Knight, do hereby certify that I am Secretary of the Illinois Commerce Commission of the State of Illinois and keeper of the records of said Commission.

I further certify that the above and foregoing is a true, correct and complete copy of Exhibit 20 introduced by Mr. Ralph W. Gallagher in the above entitled cause before the Illinois Commerce Commission.

Given under my hand and the seal of said Illinois Commerce Commission at Chicago, Illinois, this 25th day of October, A. D. 1939.

Joseph E. Knight
Joseph E. Knight
Secretary

Source of data: Moody's Bond Yield Averages are computed by Moody's Investors Service and are issued in their publications. The Bond Yield Averages are reproduced in Survey of Current Business, November 1937, 1938 Supplement, and March 1939. The above figures were taken from the last named source for the period from January 1920 to January 1939; and were taken direct from Moody's Bond Survey for the subsequent months.

SCHEDULE NO. 1
PAGE 5
MOODY'S BOND
YIELD AVERAGES
RATING BAA

2630 Compilation of Moody's Bond Yield Averages.

In the compilation of Moody's Bond Yield Averages, daily yields for each individual bond are computed on the basis of closing prices. Unweighted arithmetic averages are computed to obtain each of the series shown. The monthly series are arithmetic averages of the daily figures.

Occasional substitutions in the bond list have been made when ratings have been changed, when a bond is called, when a bond sells too far above its call price, or because of approaching maturity. Suitable adjustments (usually small), which are gradually amortized, are introduced to prevent such substitutions from impairing the comparability of the series. No convertible or other unusual issues are included and the average maturity is close to [illegible] years.

Only 60 bonds were used in the averages from 1920 to 1927, inclusive. From 1928 to 1933, inclusive 120 bonds were used, no adjustment being required to connect the two series. Since 1933, it has not been possible to find a sufficient number of representative bonds for the Industrial AAA and AA groups; they contain, respectively, 4 and 3 issues. However, the averages for these groups are given equal weighting in combining them with other group averages.

Key to Moody's Bond Ratings.

Moody's Ratings are an indicator of the relative investment quality of bonds.

The Ratings are defined by Moody's Investors Service as follows:

AAA

Bonds carrying the AAA rating represent the highest type of bond investment. Principal and interest are protected by characteristically wide margins, the fluctuation in which is not at all likely to jeopardize the security. Among all rating groups, these bonds hold the best prospect of unchanging quality.

2631

AA

Bonds carrying the AA rating rank high by reason of asset and income protection but they lack one characteristic or another of the highest type of bond investment.

A

Bonds carrying the A rating are well within the sound investment classification. Security of principal and interest may be regarded as adequate but the borrower's position is subject to greater fluctuation or the bonds are more vulnerable to such fluctuation than in the case of the first two classes.

BAA

Bonds carrying the BAA rating comprise that large group of investments which are neither very good nor very bad. In this classification some speculative elements exist. The extent and stability of income and security may be satisfactory but certainly not noteworthy.

Source of definition of Ratings: Moody's Public Utilities, 1938, page viii.

Source of data: Standard Trade and Securities (Published by Standard Statistics Company, Inc.) Volume 3, page A-26, dated January 21, 1938, and Current Statistics Section. The following explanation was furnished with the interest rates - "From 1890 to date the data have been computed by the Standard Statistics Co. from data appearing in the Commercial and Financial Chronicle. Data earlier than March 1924 are for 60-90 day commercial paper. At this time rates for both maturities were practically identical. July 1930, a change was made to extra-choice from choice, double name as the latter became inactive."

Source of data: The computations were made by the U.S. Treasury Department and represent monthly data which are averages of daily figures. Beginning January 1926, average yields are based on all outstanding Treasury bonds not due or callable for 12 years or more. Earlier figures are for Treasury bonds not due or callable for 8 years or more, together with certain Liberty Loan issues. The yields are published in the Survey of Current Business from which the above figures were taken.

Source of data: Moody's Bond Yield Averages are computed by Moody's Investors Service and are issued in their publications. The Bond Yield Averages are reproduced in Survey of Current Business, November 1937, 1938 Supplement, and March 1939. The above figures were taken from the last named source for the period from January 1920 to January 1939; and were taken direct from Moody's Bond Survey for the subsequent months.

1933	5.56	4.95	5.24
1934	6.04	4.81 4.71)	5.09
1935	4.19	3.92 4.05)	4.25
1936	3.87	3.56 3.62) *	3.76
1937	3.70	3.56 3.55)	3.49
1938	3.52	3.49 3.40)	3.47

Note: The above table shows the movement of the Average Price of Capital for Industrial, Utility (Light, Power and Gas) and Railroad Bonds. By the "Price of Capital" is meant the average yield to maturity on newly issued bonds. The figures are weighted by the amounts of all new issues floated in any year.

Source of above: Moody's Industrials, 1939, pages a35 and a36; and Moody's Public Utilities, 1939, pages a7 and a8.

---

* Represents composite of Moody's bond yield averages for 30 public utility bonds of three rating groups, Aaa, Aa and A, each group consisting of 10 bonds (see Schedule No. 4), as follows:

Year	Aaa	Aa	A	Average
1934	3.92	4.66	5.55	4.71
1935	3.52	4.02	4.61	4.05
1936	3.21	3.57	4.08	3.62
1937	3.21	3.45	3.98	3.55
1938	3.03	3.28	3.90	3.40

Source of Data: Statistics compiled by the U. S. Department of Commerce, Bureau of Foreign and Domestic Commerce, and published in Survey of Current Business. The above data for the years 1929 to 1937, inclusive, were taken from, and the twelve-months' moving totals for the years 1938 and 1939 are based on the monthly figures contained in, the aforementioned publication. For the sources and methods used in developing the statistics, see pp. 15-20 of the October, 1938 issue of Survey of Current Business.

Notes: (A) Includes Social Security benefits prior to 1938.
(B) Subsequent to December 1937, cash payments to veterans are included with direct relief.
(C) Includes benefits paid to retired railroad employees under Railroad Retirement Act.

Note: The "Standard Trade and Securities" Index Numbers of Quarterly Earnings of Industrials, Utilities and Railroads have been reduced to twelve months moving averages. By this process, each quarterly index number is made to express an average of that of the quarter in question combined with those of the three preceding quarters. Seasonal variations are eliminated.

See Page 4 of this Schedule, for Note and Source of Data.

SCHEDULE NO. 26
PAGE 3
CUSTOMERS' RATES
SOUTH AND WEST

PREVAILING RATES CHARGED CUSTOMERS BY BANKS IN PRINCIPAL CITIES

Note: Figures relate to rates charged by reporting banks to their own customers as distinguished from open-market rates. All averages are based on rates reported for three types of customer loans- commercial loans, and demand and time loans on securities. The method of computing the average takes into account (a) the relative importance of each of these three types of loans and (b) the relative importance of each reporting bank, as measured by total loans. In the two group averages (8 Other Northern and Eastern Cities, and 27 Southern and Western Cities) the average rate for each city included is weighted according to the importance of that city in the group, as measured by loans of all banks.

Source of data: The average rates of interest were computed by the Federal Reserve Board, and are contained in the Annual Reports of the Board of Governors of The Federal Reserve System and in the monthly issues of the Federal Reserve Bulletin. The interest rates are reproduced in Standard Trade and Securities, Volume 3, page A-29, dated January 21, 1938, and in Current Statistics Section. The above figures were taken from the last named source.

8 Other Northern and Eastern Cities

Source of Data:

Statistics compiled by the Board of Governors of the Federal Reserve System for the United States for all years and for the Chicago Federal Reserve District through 1930. The latter index was subsequently carried forward by the Survey of Current Business until the Chicago Federal Reserve Bank started the computation for its own district. Both indexes are reproduced in the Survey of Current Business from which the above figures were taken.

Source of Data:

Above indexes computed from date reproduced in the Survey of Current Business, a U. S. Department of Commerce publication, as follows:

(1) Based on index computed by the U. S. Department of Labor, Bureau of Labor Statistics, but adjusted to reflect comparison with the monthly average for the three years 1929–1931, instead of the average for the base period 1923–1925 as published.

(2) Based on index computed by the Illinois Department of Labor, but adjusted to reflect comparison with the monthly average for the three years 1929–1931, instead of the average for the base period 1925–1927 as published.

Source of Data:

Above indexes computed from data reproduced in Survey of Current Business, a U. S. Department of Commerce publication, as follows:

(1) Index computed from data compiled by the National Industrial Conference Board covering 2000 manufacturing plants representing 25 industries, which in 1937 employed about 1,900,000 wage earners. Similar data, compiled by the U. S. Department of Labor, Bureau of Labor Statistics and covering 89 industries, were not used inasmuch as the data are not available prior to 1932. The base period for this index is the average for the three years 1929-1931.

(2) Based on index computed by the Illinois Department of Labor, but adjusted to reflect comparison with the monthly average for the three years 1929-1931, instead of the average for the base period 1925-1927, as published, which is $28.36 taken as 100.

Source of Data: "Monthly Summary of Gas Company Statistics, Annual Supplement", issued by the American Gas Association in March, 1939.

(1) Includes natural gas sold for house heating.

(2) Includes natural gas sold to electric utilities for use in generating electric energy.

(3) Computed averages.

Note: These figures do not include natural gas used in field operations and in the manufacture of carbon black, or gas used by distributing companies in the conduct of their own operations.

Companies selling mixed manufactured and natural gas are not included in these data.

SCHEDULE NO.1

---

* Companies formerly distributing manufactured gas but which were distributing natural gas at the beginning of 1937 have been included in the above tabulation for all seven years. The data shown above for 1931 to 1937 are therefore not comparable with data on the natural gas industry previously issued for those years.

** Includes leased property rents.

Source of Data: "Annual Statistics of the Natural Gas Industry in 1937, Statistical Bulletin No. 33", issued by the American Gas Association in October, 1938.

Note: Companies selling mixed manufactured and natural gas are not included in these data.

Source of data:

Years 1926 to 1934, inclusive--Data compiled by U. S. Bureau of Mines, as represented at page 160 of record of hearing before a Subcommittee of the Committee on Interstate and Foreign Commerce, House of Representatives, 74th Congress, 2nd Session, on H. R. 11662 "To Regulate the Transportation and Sale of Natural Gas in Interstate Commerce and for Other Purposes", April 1936.

Years 1935-1936 - U. S. Bureau of Mines, "Minerals Year Book", 1937 and 1938 editions.

Year 1937 - U. S. Bureau of Mines, "Mineral Market Reports, No. M.M.S. 682", issued December 13,1938.

(1) Excluding gas used for field operations and manufacture of carbon black. Natural gas used for latter purpose is used in the State in which it is produced.

(2) Excluding amounts transported to Canada and Mexico.

(3) Five states produce over 80 percent of total natural gas production. These states, ranked according to volume of gas produced in 1937, are Texas, Oklahoma, California, Louisiana and West Virginia.

The following in reference to recent short-term financing by The Peoples Gas Light & Coke Company, is from The Commercial and Financial Chronicle, April 22, 1939:

> “Peoples Gas Light & Coke Co. Notes—
>
> Company sold $2,500,000 of promissory notes to five Chicago banks on March 9, and used the proceeds together with other funds to retire $3,000,000 in promissory notes, maturing serially from May 31, 1940 to May 31, 1942, at 100¼. The new promissory notes include $500,000 bearing interest at 1½% and maturing May 31, 1940; $1,000,000 at 1¾%, due 1941; and $1,000,000 of 2% notes due 1942. The new notes are secured by pledge of $2,752,000 of Natural Gas Pipeline Company of America first mortgage pipeline and collateral 6% bonds, series A, due 1946, and are redeemable at any time on 30 days notice at 100¼ in multiples of $500,000. Upon retirement of $3,000,000 promissory notes, the banks released $3,312,000 of Natural Gas Pipeline Company of America 6% first mortgage pipeline and collateral bonds.”

Assumptions.

A. Dividends: Cash dividends are to be paid each year at 25% of the stated value of the Capital Stock of Natural Gas Pipeline Company of America, outstanding January 1, 1939. No dividends are to be paid on the Capital Stock of Texoma Natural Gas Company until liquidation.

B. Other Net Current Assets: This caption reflects changes in Taxes Accrued resulting from the payment of Federal and State Income Taxes in the year following accrual and changes in Interest Payable based on assumptions of borrowings and repayments. Changes in current assets other than cash and changes in current liabilities other than Taxes Accrued and Interest Payable, have been assumed to be offsetting.

C. Salvage: This item was assumed to represent either cash value realized or materials reused during the year for which estimated.

D. Borowings: The borrowings were assumed to be made fifteen days in advance of the date on which the Company is obligated to make its sinking fund payments to retire bonds. Interest is assumed to be 6%, so that in effect the bonds due to be retired under the provisions of the [illegible]mpany's mortgage will be extended by the holders thereof for the additional period required. Interest on borrowings is assumed to be payable every six months. Repayments of borrowings are assumed to be made on the semi-annual date at which the recurring six months interest becomes due.

2791

National Income Payments

Years 1929 to 1939, Inclusive
(Millions of Dollars)

Source of Data: Statistics compiled by the U. S. Department of Commerce, Bureau of Foreign and Domestic Commerce, and published in Survey of Current Business. The above data for the years 1929 to 1937, inclusive, were taken from, and the twelve-months' totals for the years 1938 and 1939 are based on the monthly figures contained in the aforementioned publication.

Notes: (A) Includes income in kind as well as cash income.

(B) In addition to benefits payable under the Social Security program, this item includes pensions paid out by private industries and governmental agencies, compensation for industrial accidents, pensions to veterans, and also loans to World War veterans on their adjusted service certificates, and since June of 1936 adjusted service certificate payments less prior loans. These latter items account for the sharp rise in this type of income in 1931 and 1936.

Notes:- (1) Includes industrial also.
(2) This includes cooking and waterheating as well as spaceheating by those customers classified as spaceheating.
(3) Includes municipal only.
(4) No number of customers reported.
(5) Customers added during the year made these results low.

Notes:-

(1) Includes natural and mixed gas territories.
(2) Includes both northern and southern divisions.
(3) The Coal Products Manufacturing Company, a subsidiary supplying coalgas, was merged with Western United Gas and Electric Company on October 31, 1931. This means that comparative data on earnings can only be obtained from 1932 to date.
(a) Reflects the results of the rate increase.
(b) After deducting $2,667,371 from Gross Operating Revenue and $2,140,301 from Net Available for Fixed Charges as reported by the company to be the result of the rate increase.

Source of Data:-

Annual reports made by the companies to the Illinois Commerce Commission.

For the Seventh Circuit

No. 7454

NATURAL GAS PIPELINE COMPANY OF AMERICA
AND TEXOMA NATURAL GAS COMPANY,
Petitioners,

vs.

FEDERAL POWER COMMISSION AND ILLINOIS
COMMERCE COMMISSION,
Respondents.

Petition for Review of Interim Order of the Federal
Power Commission.

INDEX.

Petition of the Illinois Commerce Commission, filed with the Federal Power Commission, September 23, 1938 1
Order of Federal Power Commission instituting Investigation, entered October 14, 1938 6
Answer of Natural Gas Pipeline Company of America and Texoma Natural Gas Company to Petition, filed November 16, 1938 9
Order fixing date of hearing, entered April 14, 1939 13

PROCEEDINGS AT HEARING.

Statement by Examiner 15
Statement by Mr. Morgan 16
Colloquy 25, 33, 64
Statement by Mr. Booth 28
Statement by Mr. May 31

ABSTRACT OF TESTIMONY.

WITNESSES FOR FEDERAL POWER COMMISSION.

Testimony of:

Brown, Claude C. 35, 36
Knapp, Charles W., Jr. 2004, 2103, 2588
Smith, Charles W. 2041, 2222, 2632

WITNESSES FOR ILLINOIS COMMERCE COMMISSION.

Testimony of:

Kleinman, Fred 2075, 2382
Ostrander, E. D. 1977, 2277
Woodford, John M. 57, 393

Vol. I, pp. 1 to 646; Vol. II, pp. 647 to 1310; Vol. III, pp. 1311 to 1976; Vol. IV, pp. 1977 to 2672; Vol. V, pp. 2673 to 3031; Vol. VI, pp. 3033 to 3417; Vol. VII, pp. 3419 to 3902; Vol. VIII, pp. 3903 to 4022.

WITNESSES FOR DEFENDANTS.

Testimony of:

Biddison, P. McDonald . . . 1041, 1284
Brainard, W. F. . . . 481
Brown, Floyd C. . . . 491, 1311, 1636

2821 UNITED STATES OF AMERICA. Filed Nov. 7, 1939.

FEDERAL POWER COMMISSION.

Illinois Commerce Commission,
Complainant,
vs.
Natural Gas Pipeline Company of America,
and
Texoma Natural Gas Company,
Defendants.
Docket No. G-109.

In the Matter of
Natural Gas Pipeline Company of America,
and
Texoma Natural Gas Company.
Docket No. G-112.

MOTION FOR AN IMMEDIATE ORDER REDUCING RATES.

Come now, John E. Cassidy, Attorney General of the State of Illinois, by Harry R. Booth, Assistant Attorney General, for and on behalf of the complainant, Illinois Commerce Commission, and George Slaff, of Counsel for the Federal Power Commission, with whom is D. A. Myse, in the above entitled cause, who respectfully represent as follows:

1. That on September 23, 1938 a petition was filed by the Illinois Commerce Commission praying that a citation be issued directing the defendants herein to show cause why the rates charged for natural gas in the State of Illinois should not be reduced and further that an order be entered setting fair, just and reasonable rates for such natural gas.

2. That on October 14, 1938 this Honorable Commission on its own motion ordered an investigation to enable the Commission to determine whether the rates and charges of the defendants are unjust or unreasonable and if so to fix by appropriate order or orders just and reasonable rates or charges.

3. That on November 16, 1938 the defendants filed their

answer to the petition denying that their rates or charges were unreasonable or unjust and also contesting the jurisdiction and power of this Commission to enter any order or orders such as to affect the rates or charges of the defendants.

2822 4. That on April 14, 1939 this Commission entered an order consolidating the two cases, G-109 and G-112, for the purpose of hearing, and fixing May 8, 1939, as the date of the first hearing.

5. That hearings were begun on May 8, 1939 at Chicago and have since continued for approximately 55 days during which a total of approximately 8000 pages of testimony has been taken, 37 witnesses have appeared for the defendants, who introduced 135 exhibits, and 6 witnesses, and approximately 45 exhibits have been introduced for the two Commissions.

6. That for the purpose of this proceeding, Natural Gas Pipeline Company of America and Texoma Natural Gas Company consider themselves, and are here treated, as a single enterprise and will hereafter collectively be referred to as "the Companies."

7. That from a consideration of all the evidence it appear:

I. Earnings 1932—1938.

a. That the evidence on behalf of the Companies shows total actual income available for return and for amortization of investment, after payment of operating expenses and taxes during the entire past period (seven years) of operation, to date of January 1, 1939, in the amount of at least $53,405,092 ("Revenue Remaining for Amortization and Return," Exhibit 140, p. 1, line 14); that during the same period a total of $19,558,810 was charged to operations for amortization of investment, consisting of $11,620,210 (Ex. 136) on account of depreciation, $1,457,278 on account of depletion, and in addition, $6,481,322 for retirements beyond what was charged against the depreciation and depletion reserves; and that deducting the total charges of $19,558,810 from the $53,405,092 of income leaves $33,846,282 for return on investment during the period or an average of $4,835,183 per annum, after all charges for depreciation, depletion and retirements. That, at the end of 1938 the Companies' depreciation and depletion reserve was $12,557,892 (Exhibit 137).

b. That the cost of the plant, including gas leaseholds, at the beginning and end of each of the seven years, as claimed by the Companies, is as follows (Ex. 137):

2823

	Beginning	End
1932	$ 61,113,958	$ 61,804,730
1933	61,804,730	59,632,173
1934	59,632,173	59,533,555
1935	59,533,555	60,029,067
1936	60,029,067	59,529,749
1937	59,529,749	59,436,823
1938	59,436,823	59,197,843
	$421,080,055	$419,163,940

7-Year Average	$60,017,428
Working Capital (Ex. 140)	975,000
	$60,992,428

c. That said average plant cost, together with working capital, amounted to approximately $61,000,000 for the 7-year period, which sum is subject to reduction on account of depreciation and depletion for which purpose the Companies have built up reserves and for which they themselves make deductions from the plant cost figures for the amount of depreciation and depletion that they admit has occurred (Ex. 141); that the $4,835,183 average annual return for the 7 years amounts to substantially 8 per cent per annum on $61,000,000, without any deductions from the latter amount; and that for the last year, 1938, the net earnings from operations ($9,884,745, Ex. 136), after depreciation charges of $1,978,408, depletion charges of $261,658, and retirements of $992,567, amounted to $6,652,112, or approximately 11 per cent on the plant cost, plus working capital, without deducting any part of the depreciation and depletion reserves of $12,557,892.

d. That the total net profit available to the stockholders after payment of bond interest and amortization of bond discount and expense was at least $8,244,436 (Ex. 136) for the 7 years, amounting to an average of $1,177,777 per annum, or an annual average return of 39.3 per cent on the $3,000,000 capital stock of the Natural Gas Pipeline Company of America.

e. That the bonds represent practically the entire investment, claimed by the Companies, aside from the depreciation and depletion reserves, as is shown by the following table:

Dec. 31	Bonds (1) (Ex. 137, p. 1)	Reserves (2) (Ex. 137, p. 1)	Total (1) & (2) (3)	Plant (Undepreciated) (4) (Ex. 137, p. 1)
1931	$59,999,000	—	$59,999,000	$61,113,958
1932	59,999,000	$ 1,582,988	61,581,988	61,804,730
1933	60,999,000	3,139,028	64,138,028	59,632,173
1934	58,999,000	4,800,408	63,799,408	59,533,555
1935	56,499,000	6,507,066	63,006,066	60,029,067
1936	52,599,000	8,233,048	60,832,048	59,529,749
1937	50,300,000	10,458,256	60,758,256	59,436,823
1938	46,500,000	12,557,892	59,057,892	59,197,843

2824 f. That from the above table it appears that on December 31, 1933 the total bonds outstanding stood at $60,999,000, or more than the total in the plant account; and that thereafter bonds have been retired, while depreciation and depletion reserves have been accumulated, so that the bondholders, who are also the stockholders, have been paid back a very substantial proportion of their capital out of depreciation and depletion funds.

g. That if the gross investment claimed by the two companies, without deductions for retirements or for accrued depreciation and depletion, be taken as a base for the purpose of entering an immediate order, operations should be charged with annual amortization on a sinking-fund basis.

h. That the minimum sinking-fund interest rate should be 6 per cent; that the interest rate on the Companies' bonds is 6 per cent; that the Companies are actually retiring their bonds; and that a portion of the amortization funds could properly be invested in additions to the property and credited with the rate of return which is to be earned on the property.

i. That the computation of the amortization annuity should be at least on the basis of semi-annual compounding of interest, as the bond interest is paid semi-annually and as semi-annual compounding is in accordance with the testimony of the Companies' witness Delafield (R. 5166).

j. That in accordance with the Companies' own estimate of the life of their property the minimum period for amortizing the investment is 23 years; that the annual amount required to amortize one dollar at the end of 23 years at 6 per cent interest compounded semi-annually is $0.020725.

k. That the gross investment, without deduction of any retirements, claimed by the Companies to have been theretofore made, and including working capital, stood at $67,173,761 at the end of 1938 (Ex. 140, p. 1, line 19); that $1,392,176 per annum ($67,173,761 x 0.020725) would amortize this amount over the 23-year life of the enterprise, disregarding salvage; and that the Companies' esti-
2825 mate of the total capital expenditures for the entire 23-year period, less salvage, which amounts to $78,284,009 (Ex. 140) could be amortized by an annual allowance of $1,622,436 ($78,284,009 x 0.020725) which amount, set aside annually for 23 years at 6 per cent interest compounded semi-annually, will accumulate the total of $78,284,009.

m. That taking this amount, $1,622,436, in lieu of the charges made by the Companies in the first 7 years for depreciation, depletion and retirements, the result is as follows:

Investment at 1/1/32 (Ex. 137)	$ 61,113,958
Plus working capital	975,000
	$ 62,088,958
Gross investment to 12/31/38 including working capital (Ex. 140)	67,173,761
	$129,262,719
Average Investment	$ 64,631,360
Average revenue remaining for amortization and return (Ex. 138, p. 1)	$ 7,629,299
Amortization	1,622,436
Amount available for return	$ 6,006,863
Per cent on average investment	9.3%

II. Estimated Earnings for 1939-1941 Inclusive.

a. That the amount of $1,622,436 is more than ample annual amortization provision for the 16 years following January 1, 1939, as compared with the 7 years prior to that date, because the Companies have actually provided for more amortization in the past 7 years than would have resulted from the above charge; that the sinking fund that would result from an annual charge of $1,622,436 for 7 years is $13,860,471, whereas the Companies have actually charged $19,558,810 against operations for depreciation, depletion and retirements, and still have made more than ample return as heretofore shown; and that the Companies in the past 7 years have retired $14,499,000 of their 6 per cent bonds, which amount is substantially greater than the sinking fund of $13,860,471 which would have resulted from the investment of $1,622,436 in the Companies' bonds for 7 years; and that in addition to retiring the above amount of bonds the Companies paid a total of $9,150,000 in dividends (Ex. 136) on $3,000,000 of capital stock.

2826 b. That based upon the annual amortization figure of $1,622,436, and using the Companies' estimates of earnings available for amortization and return, the income available for return in the years 1939 to 1941 inclusive, will be at least:

	1939	1940	1941
Total capital expenditure & working capital at beginning of year (Ex. 140)	$ 67,173,761	$ 68,091,587	$ 69,414,046
End of year (Ex. 140)	68,091,587	69,414,046	70,708,776
	135,265,348	137,505,633	140,122,822
Average	67,632,674	68,752,817	70,061,411
Revenue available for amortization & return (Ex. 140)	$ 9,790,310	$ 9,564,228	$ 9,400,483
Amortization	1,622,436	1,622,436	1,622,436
Income available for return	$ 8,167,874	$ 7,941,792	$ 7,778,047
Per cent on average gross investment (above)	12.1%	11.5%	11.1%
6% on average gross investment	$ 4,057,960	$ 4,125,169	$ 4,203,685
Excess over 6%	$ 4,109,914	$ 3,816,623	$ 3,574,362
Excess over 6½%	$ 3,771,750	$ 3,472,859	$ 3,224,055

c. That based upon the highest charges made by the Companies in any one year for depreciation ($2,034,754 in 1937, Ex. 136) and for depletion ($320,527, in 1937), and also charging against operations the entire amount of retirements, less salvage, estimated by the Companies for 1939 ($209,484, less salvage of $50,832, or $158,652, Ex. 117)—although a large but unknown part of the retirements would actually be charged against the depreciation reserve—the income for 1939 would be as follows:

Estimated revenue remaining for amortization and return (Ex. 140, p. 2, line 14)		$9,790,310
Less: Depreciation	$2,034,754	
Depletion	320,527	
Retirements	158,652	2,513,933
Income available for return		$7,276,377

d. That the cost of property as shown by the Companies' exhibits remaining at January 1, 1939, to wit, $59,197,843, plus working capital of $975,000, gives a total of
282 $60,172,843; that the charges made by the Companies in the past for depreciation and depletion, less retirements that have been charged to the reserve, have resulted in reserves of $12,557,892 at the same date; that a maximum investment rate base would be the difference between these amounts, or $47,614,951, which is approximately one million dollars more than the outstanding bonds; that this difference will diminish as the reserve accumulations grow; and that on the total of $60,172,843, without any deductions for depreciation or depletion, the net earnings for 1939, to wit, $7,276,377, as set forth in paragraph "C," just preceding, will be not less than 12.1 per cent, and that such earnings will produce a return of $3,666,006 more than 6 per cent or $3,365,142 over 6½ per cent on said total of $60,172,843.

e. That although the Companies estimated as recently as September 8, 1939 (Exs. 136, 140) that the net earnings for 1939 would be less than the net earnings for 1938, the books of the Companies disclose a substantial gain in both gross revenues and net earnings for the first 8 months of 1939 compared with the corresponding period in 1938, as is indicated by the following table:

	8 Months Ended Aug. 31, 1939	8 Months Ended Aug. 31, 1938	Increase or Decrease*
Gross Earnings from operations	$10,460,897.18	$9,457,471.97	$1,003,425.21
Operating Expenses	3,233,293.23	3,032,386.72	200,906.51
Net Earnings from Operation	$ 7,227,603.95	$6,425,085.25	$ 802,518.70
Non-Operating Income	677.76	12,877.82	12,200.06*
Net Earnings of Company	$ 7,228,281.71	$6,437,963.07	$ 790,318.64
Less: Other Charges			
Interest Expense	$ 1,819,056.36	$1,956,759.25	$ 137,702.89*
Amortization of Bond Discount and Expense	170,167.32	170,167.32	—
Depreciation	1,358,804.20	1,208,667.22	150,136.98
Depletion	189,549.89	165,598.40	23,951.49
Retirement Expense	205,920.14	680,971.50	475,051.36*
Total Other Charges	$ 3,743,497.91	$4,182,163.69	$ 438,665.78*
Net Earnings Available for Dividends	$ 3,484,783.80	$2,255,799.38	$1,228,984.42
Dividends	1,500,000.00	1,687,000.00	187,000.00*
Balance	$ 1,984,783.80	$ 568,799.38	$1,415,984.42

(*) Negative Amounts.

f. That included in the Companies' figures of property
cost at January 1, 1939 is the amount of $9,367,364 for cost
of gas leaseholds at that date, which amount is subject
2828 to deductions for depletion; that the Companies' wit-
ness, R. J. Wallace, testified to a present value of
the leaseholds, in their depleted condition, of $13,334,775
(Ex. 131, revised by Ex. 146); that if this figure be sub-
stituted for the investment figure of $9,367,364, and if only
the depreciation of $2,485,079 which defendants deduct
from the original cost of property, other than leaseholds
(Ex. 141), is deducted from the cost of such other property,
a total of $61,655,175 is obtained; and that the net earnings
of $7,276,377 for 1939 are 11.8 per cent of $61,655,175, or
$3,577,066 in excess of 6 per cent, or $3,268,791 in excess of
6½ per cent.

III. Return Based upon the Companies' Reproduction Cost Estimate.

a. That on the basis of their reproduction cost estimate the Companies will earn not less than $3,211,661 above a 6 per cent return for 1939, using the Companies' own charges for depreciation and depletion, charging also to operations the entire amount of retirements, less salvage, estimated by the companies for the current year 1939, and deducting from reproduction cost new only the "viewed" depreciation as testified to by Company witness, Biddison, amounting to $2,866,758 (Exs. 125, 142) as compared to the depreciation reserve of $11,405,038 (Ex. 137):

Reproduction Cost New, excluding Gas Reserves (Ex. 142)	$56,302,250
Less Viewed Depreciation	2,866,758
	$53,435,492
Gas Reserves (Ex. 146)	13,334,775
Working Capital (Ex. 125)	975,000
Reproduction Rate Base	$67,745,267

Income for Depreciation, Depletion and Return, 1939 (Estimated) (Ex. 140)			$ 9,790,310
Less: Depreciation		$2,034,754	
Depletion		320,527	
Retirements, total for 1939 (Ex. 117)	$209,484		
Less Salvage	50,832	158,652	2,513,933
			$ 7,276,377
Per Cent on Rate Base			10.7%
6 Per Cent on Rate Base			$ 4,064,716
Excess over 6 per cent			$ 3,211,661
Excess over 6½ per cent			$ 2,872,935

2829 b. That 6 per cent on the above rate base would cover the entire bond interest of $2,790,000 on the bonds outstanding at January 1, 1939 (which will be further reduced) and the annual amortization of bond discount and expense of $255,251 (Ex. 136) and still leave $1,019,465 for the stockholders or 34 per cent on the $3,000,000 stock of Natural Gas Pipeline Company.

c. That the net earnings available for return, with the annual amortization allowance of $1,622,436 sufficient to amortize the Companies' estimate of total investment of $78,284,009 over the life of the project, will show the following results, using an undepreciated reproduction cost rate base:

Reproduction cost new (excluding gas reserves)	$56,302,250
Gas reserves	13,334,775
Working capital	975,000
Rate base	$70,612,025
Income for depreciation, depletion and return	$ 9,790,310
Less amortization	1,622,436
	$ 8,167,874
Per cent on rate base	11.6%
6 per cent on rate base	$ 4,236,722
Excess over 6 per cent	$ 3,931,152
Excess over 6½ per cent	$ 3,578,092

d. That no separate allowance should be made for going value.

IV. Rate of Return.

a. That a fair rate of return for these Companies is not more than 6 to 6½ per cent.

V. Relationship of Gross Reduction to Reduction in Net Earnings.

a. That a reduction in gross revenue of $3,000,000, or any other amount, would not cause a similar reduction in net earnings since the net taxable income would be reduced, thus reducing Federal income taxes; that based upon the Federal income tax rate of 18 per cent under the Revenue Act of 1939 the tax saving due to a reduction of $3,000,000 in gross revenue without change in expenses would be $540,000, so that the net earnings would be reduced by only the difference, or $2,460,000.

2830 8. That Sections 4(a) and 5(a) of the Natural Gas Act provide as follows:

Section 4(a)—

"All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful."

Section 5(a)—

"Whenever the Commission, after a hearing * * * shall find that any rate * * * or * * * any * * * contract affecting such rate * * * is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order. * * *"

9. That the evidence before the Commission now clearly establishes that the present rates charged and collected by the Natural Gas Pipeline Company of America are unjust and unreasonable.

10. That the Companies have had a full and complete hearing; that counsel for the Companies stated on October 6th that their case on direct had been completed (R. 5974).

11. That cross examination of Companies' witnesses, the introduction of complainant's evidence and evidence on behalf of the Federal Power Commission, the taking of Companies' rebuttal evidence and cross examination thereon will consume much additional time so that the closing of this case will be delayed for a long time in the future.

12. That to aid the complainant materially in fixing fair and reasonable rates for gas sold to ultimate consumers in the State of Illinois it is necessary that an immediate interim order be entered reducing the rates and charges of Natural Gas Pipeline Company of America.

13. That nothing herein contained is to be taken as an admission of the accuracy or propriety of any of the claims made by the Companies or their witnesses.

2831 Wherefore, your petitioners pray that the Commission enter an immediate interim order fixing just and reasonable rates for gas sold by Natural Gas Pipeline Company of America.

DEFENDANTS' PLEAS TO THE JURISDICTION OF THE COMMISSION IN REPLY TO MOTION FOR AN INTERIM ORDER REDUCING RATES.

Now come the defendants-respondents, hereinafter styled defendants, in response to the "Motion for an Immediate Order Reducing Rates" filed herein by John E. Cassidy, Attorney General of the State of Illinois, and Harry R. Booth, Assistant Attorney General, on behalf of the Illinois Commerce Commission, the latter hereinafter called complainant, and by George Slaff, of counsel for the Federal Power Commission, and D. A. Myse, attorney for the Federal Power Commission, the latter hereinafter styled the Commission, and present their several pleas to the jurisdiction of the Commission to grant said motion or to enter an interim order reducing the prices and charges of defendants for natural gas.

I.

2833 Defendants renew the plea to the jurisdiction of this Commission contained in Paragraphs 6 and 7 of their original answer to the complaint filed with the Commission by complainant, Docket G-109, and say that the Commission has no power or authority to enter any order attempting to change, modify or set aside any charge or price at which Natural Gas Pipeline Company of America is selling gas to Chicago District Pipeline Company or to other utilities in the State of Illinois or elsewhere, or to substitute and prescribe any different charges or prices for such commodity, or in any way to deprive defendants of their privileges under contracts entered into by defendants with those purchasing natural gas from them at wholesale prior to the enactment of the Natural Gas Act.

Defendants again show that they in legal effect and in fact constitute a single enterprise engaged in the business of owning natural gas leases or reserves in the State of Texas, developing such reserves, producing gas therefrom, and transporting their own gas through their own pipeline facilities to points in the States of Kansas, Nebraska, Iowa and Illinois, and selling such commodity at wholesale to selected distributors and industrial consumers under private contracts; that under the terms of said contracts, defendants, prior to the enactment of the Natural Gas Act, by agreement fixed the prices and charges at which their gas has been and is being sold at wholesale; that under the terms of said contracts, defendants, prior to the enactment of the Natural Gas Act, dedicated their
2834 reserves, their pipelines, and their facilities to the performance of their obligation to sell and deliver gas to the respective parties to such contracts; that the enterprise or business of defendants is of a strictly private character, not affected with a public interest in the sense that Congress would have jurisdiction or authority to enact legislation purporting to authorize the Commission to regulate the charges or prices for which their natural gas is sold; and the Natural Gas Act, in so far as it purports to confer on the Commission any jurisdiction, power or authority to regulate or change such prices, and any rules, regulations and orders of the Commission attempting to exercise any such purported jurisdiction, are null and void as against these defendants, because the inevita-

ble operation and effect thereof would be to deprive defendants of their property and liberty of contract without due process of law, in violation of the Fifth Amendment to the Constitution of the United States.

II.

The Commission has no jurisdiction under the Natural Gas Act to reduce the rates or prices at which defendants are selling natural gas, by interim order or otherwise, pending the final termination of the proceedings and hearings now being conducted and held by the Commission, through its Examiner, and not then unless and until, after the conclusion of the hearing and after defendants have had an opportunity to be heard in their briefs and argument on the facts presented by the record and the law applicable thereto, the Commission shall find that the rates and prices charged and collected by the de-
2835 fendants are unjust, unreasonable, unduly discriminatory or preferential.

In this connection defendants show that they and the other parties to said proceeding are in the midst of the hearing now being conducted and held in the consolidated proceedings under the above titles and docket numbers; that the hearing now in progress began on May 8, 1939, and has continued since that date, numerous sessions having been held in the city of Washington and in the city of Chicago. On October 6, 1939, defendants announced that they had completed their direct testimony; but defendants now have the right, which they propose to exercise, to examine their witnesses who have heretofore testified, after they shall have been examined by counsel for complainant and the Commission, for the purpose of developing such additional facts on redirect as may appear necessary and proper in the premises, to cross-examine the witnesses who shall be called to testify against defendants by complainant and by counsel for the Commission, to offer such explanation and clarification as they deem proper of any facts or circumstances which may be presented to the Examiner by complainant and counsel for the Commission in the course of the hearing as a result of the investigation now in progress, and to offer substantial original testimony in rebuttal.

Counsel for complainant and the Commission have both stated in open hearing that they have additional cross-

examination of defendants' witnesses and that they propose to offer testimony on the issues involved in this proceeding. Representatives of complainant and the
2836 Commission are now examining defendants' records and properties in an effort to develop additional testimony to support the contention of complainant and counsel for the Commission herein. The transcript of the oral testimony heretofore received in evidence now embraces approximately 10,000 pages, and more than 200 exhibits, some of which contain several hundred pages of data and material, have already been offered in evidence. Among the exhibits are numerous maps and charts which can only be understood after a careful analysis of the testimony of the witnesses in connection with whose testimony the exhibits were introduced.

Numerous issues of fact are presented by the record and on these issues there is sharp difference of opinion and contention between defendants on the one hand and complaint and counsel for the Commission on the other hand. Numerous important and serious questions of law are raised by the record. These issues of fact and of law cannot be resolved and determined by the Commission until after the hearing has been finally terminated and until defendants have had an opportunity by brief and argument to present their contentions on the issues both of law and of fact first to the Examiner and then, if necessary, to the Commission as a whole. The prices and charges of defendants for natural gas which complainant and counsel for the Commission seek to reduce by interim order were fixed by contracts negotiated and entered into by
2837 defendants and their several purchasers long prior to the enactment of the Natural Gas Act. The contracts under which such prices and charges were fixed have been filed with the Commission in pursuance of the Natural Gas Act, whereupon they became and now are legal and lawful rates, the reasonableness of which was established prima facie upon the filing of such contracts with the Commission.

Under the facts above stated the Commission is without jurisdiction to reduce the charges and prices fixed by defendants' contracts until, after hearing, it shall find from the evidence and record as a whole that such rates and charges are unjust, unreasonable, unduly discriminatory or preferential. Under the established law defendants are entitled not only to introduce their own direct testimony but to cross-examine the witnesses who appear against

them, to explain and clarify any facts or circumstances which complainant and counsel for the Commission seek to use against defendants, to interrogate their witnesses on redirect examination for the purpose of developing and elaborating upon the testimony of such witnesses on direct and cross examination, and to rebut by original testimony the testimony which may be offered through witnesses called by complainant or counsel for the Commission. Under the terms of the Natural Gas Act the Commission is without authority and jurisdiction at this stage of the proceeding to enter a finding or undertake to enter a finding that the existing charges and prices for which defendants sell their natural gas are unjust, unreasonable, unduly discriminatory or preferential, and it will have no juris-
2838 diction to make such a finding until defendants have
been heard by brief and oral argument on the entire record heretofore developed and to be developed on all of the issues bearing on the question of whether their prices and charges are unjust, unreasonable, unduly discriminatory or preferential.

In the proceedings to determine whether or not defendants' charges and prices are unjust, unreasonable, unduly discriminatory or preferential, the Commission is performing quasi judicial functions, and these functions must have been fully discharged upon the full record, and only in the event that the Commission shall then find that the charges and prices of defendants are unjust, unreasonable, unduly discriminatory or preferential would the Commission have jurisdiction and power under the Natural Gas Act to enter any order reducing the rates and charges fixed by the contracts under which defendants sell their natural gas.

III.

The Natural Gas Act confers upon the Commission no power or jurisdiction to enter an interim order pending the final termination of the hearing and an opportunity by defendants to be heard, by brief and by oral argument, on the law and the facts presented by the whole record, and in the absence of such statutory authority an interim order reducing defendants' rates and charges would be null and void for want of jurisdiction.

IV.

The Commission is without authority to entertain the motion for an interim order for the reason that there
2839 is a fatal defect of parties having authority to present and prosecute such motion. Complainant is a State board or commission created by statute enacted by the legislature of the State of Illinois, with its authority and powers limited to those expressly conferred under the terms of the statute. There is no law or statute of the State of Illinois conferring upon complainant any power or authority to appear as a litigant before the Federal Power Commission or any other Federal board or commission except the Interstate Commerce Commission. Messrs. George Slaff, of counsel for the Commission, and D. A. Myse, attorney for the Commission, appear in this record as counsel and attorney, respectively, for the Commission. Any act that they perform, therefore, is necessarily performed on behalf of the Commission, and this Commission, through its counsel or otherwise, cannot appear as a litigant or movant before itself sitting in its quasi judicial and quasi legislative capacity. Such a proceeding would constitute the Commission both the litigant and the judge, and such a proceeding would deny defendants due process of law, in violation of the due process clause of the Fourteenth Amendment to the Constitution of the United States, and any order entered in pursuance of such a proceeding would be null and void.

Wherefore, defendants pray that upon hearing their several pleas to the jurisdiction of the Commission be sustained and that the motion for an immediate order reducing rates be dismissed or denied.

CONDITIONAL ANSWER OF DEFENDANTS TO THE MOTION FOR IMMEDIATE ORDER REDUCING RATES FILED BY COMPLAINANT AND COUNSEL FOR THE COMMISSION.

Without waiving their several pleas to the jurisdiction of the Commission to enter an interim order or any order reducing defendants' prices and charges for natural gas, but still insisting on each of said pleas, and subject only to a final order and judgment overruling each of said pleas to the jurisdiction, the defendants-respondents, hereinafter styled defendants, come now and file their answer and reply to the "Motion for an Immediate Order Reducing Rates" filed herein by John E. Cassidy, Attorney General of the State of Illinois, and Harry R. Booth, Assistant Attorney General, on behalf of Illinois Commerce Commission, the latter hereinafter called complainant, and by George 2842 Slaff, of counsel for the Federal Power Commission, and D. A. Myse, attorney for the Federal Power Commission, the latter hereinafter styled the Commission.

I.

The entry by the Commission of an interim order reducing defendants' rates and charges, as suggested in said motion, prior to the final conclusion of the hearing now pending and without a full consideration by the Commission of the complete record developed and to be developed at said hearing, including the exhibits heretofore offered in evidence and to be hereafter offered in evidence, would manifestly operate to violate the rights of defendants to a full hearing on the primary issue in this proceeding, namely, the question of whether or not the existing prices and charges of defendants for natural gas are unjust, unreasonable, unduly discriminatory or preferential, and to deprive defendants of due process of law.

The record of the hearing now in progress contains approximately 10,000 pages of oral testimony and more than 200 exhibits, consisting of maps, charts and tabulations, some of which contain several hundred pages and all of which must be read carefully in connection with the testimony of the witnesses through whom such exhibits were introduced. Only a few of the numerous witnesses who have testified for the defendants have been cross-examined, and complainant and counsel for the Commission have called to the witness stand only five or six witnesses whom defendants have had an opportunity to cross-examine.

Complainant and counsel for the Commission have 2843 both announced that they propose to cross-examine defendants' other witnesses and to themselves offer witnesses and exhibits against the contentions of the defendants in this cause. Defendants have a right to examine their own witnesses further on redirect after they are cross-examined by complainant and counsel for the Commission, to cross-examine the witnesses subsequently to be produced by complainant and counsel for the Commission, and to offer testimony in rebuttal of the testimony of the witnesses who testify against them. It is the purpose of defendants to exercise their right and to cross-examine the witnesses who will be called to testify against them, to re-examine their own witnesses after they have been cross-examined by complainant and counsel for the Commission, and to offer substantial rebuttal testimony. They have the right, which they expect to exercise, to offer such explanation and clarification as may be necessary to explain any facts or circumstances which may be developed as a result of the investigations now pending by representatives of complainant and the Commission into the records and affairs of defendants.

The evidence in these proceedings has been heard, and doubtless will be heard hereafter, by an Examiner designated by the Commission. There has been no closing of the evidence and no report of the Examiner with proper and reasonable opportunity to the defendants to lodge exceptions to the Examiner's report should they desire to do so. The members of the Commission have not read, and would find it utterly impracticable to read and undertake to digest, the voluminous testimony and exhibits 2844 which have been offered in this cause.

Defendants' prices and charges are based upon contracts executed prior to the enactment of the Natural

Gas Act, and no order affecting such prices and charges entered prior to a consideration in due order of proceedings of the entire record heretofore developed and to be hereafter developed would be authorized or valid, whether same be a final or an interim order.

II.

The proponents of the motion wholly disregard the various elements which must be considered by the Commission in forming a judgment with respect to the primary question of whether or not defendants' prices and charges are unjust, unreasonable, unduly discriminatory or preferential, and the entry of an order at this time, prior to a full and complete hearing on the record as it now stands and on the record as it shall hereafter be developed through the cross-examination of defendants' witnesses and through other witnesses to be offered by defendants and by complainant and counsel for the Commission, would be a violation of the rights of defendants under the process clause of the Fourteenth Amendment to the Constitution of the United States.

The proponents apparently assume that the Commission has authority to determine whether or not the prices and charges of defendants for natural gas are unjust, unreasonable, unduly discriminatory or preferential by merely showing that a reduction in the existing prices and charges would not result in confiscation of defendants' property.
2845 Defendants deny and challenge the contention of the proponents of the motion that any reduction in their prices and charges would not result in confiscation. However, the Commission is required to determine from all the evidence adduced at the hearing and to be hereafter adduced whether or not defendants' prices and charges are unjust, unreasonable, unduly discriminatory or preferential, and before it can enter any order changing such prices and charges there must first be a finding from all the evidence that the prices charged under defendants' contracts are, under all the circumstances, unjust, unreasonable, unduly discriminatory or preferential. The return to the defendants on the fair value of their property is only one element to be considered by the Commission in first determining whether or not such prices are unjust, unreasonable, unduly discriminatory or preferential. A

finding that such prices are unjust, unreasonable, unduly discriminatory or preferential must be made by the Commission after a full hearing to final conclusion on all the issues of fact and of law, and any interim order reducing defendants' prices and charges prior to such a finding would manifestly deprive defendants of due process of law, in violation of the Fourteenth Amendment.

III.

Defendants deny the conclusions contained in the fact allegations set out in the motion. They say that in making such allegations the proponents of the motion have
2846 wholly misconstrued defendants' evidence and contentions. They have improperly combined certain features of defendants' exhibits addressed to different angles of the case. They have wholly disregarded the existing law as to what constitutes the rate base upon which the rate of return regulated concerns are entitled to earn shall be calculated, and have wholly disregarded the testimony of numerous witnesses who have testified for defendants on the various facts and elements which the Commission must consider in arriving at a proper rate base and a proper rate of return. They have assumed a right in the Commission to enter an order, in the midst of a hearing the primary object of which is to determine whether or not defendants' prices and charges are unjust, unreasonable, unduly discriminatory or preferential, arbitrarily and prematurely reducing the prices and charges of defendants for natural gas.

IV.

The record as already made affirmatively presents sharp conflicts between defendants on the one hand and complainant and counsel for the Commission on the other hand as to numerous issues of fact and of law which the Commission can determine only after full hearing and after consideration of the entire record. Some, but not all, of these issues are those going to historical cost of defendants' properties, book cost of defendants' properties, book value of defendants' properties, reproduction cost new less viewed depreciation, fair value, depreciation, the allowance for amortization, the risks inherent in the business 2847 in which defendants are engaged, the peculiar risks confronting the particular enterprise of defendants, a fair rate of return and all of the elements and factors which must be considered in connection with arriving at a fair rate of return, the prices at which defendants' gas is sold for the various uses to which it is put, and the value of defendants' gas at the places which the same is marketed as compared with the prices charged by others selling natural gas at wholesale under similar circumstances. All of these issues present also serious and important questions of law which the Commission must weigh and consider before it can arrive at any finding or conclusions as to the primary issue, which it, in its quasi judicial capacity, must determine before it would have any authority to reduce the prices and charges of defendants for natural gas.

Defendants are entitled to a full and complete hearing on all of these questions, including the right to be heard on all the issues of fact and of law by brief and oral argument before the Examiner, to a report accompanied by recommendations by the Examiner to the Commission thereon, to the right to file exceptions to such report should they deem it proper and necessary to do so, and to present their exceptions by brief and oral argument to the Commission.

Premises considered, defendants pray that said motion be dismissed or in any event denied.

Opinion No. 49.

* * (Caption—G-109 and G-112) * *

MEMORANDUM OPINION.

BY THE COMMISSION:

The Illinois Commerce Commission, on September 23, 1938, filed a petition with this Commission alleging that the rates and charges for natural gas charged by the above named defendants-respondents (operated as a single enterprise and so treated herein) were unjust and unreasonable and prayed that said companies be required to show cause why rates for natural gas sold by them in the State of Illinois should not be reduced and that an order be entered determining fair, just, and reasonable rates for the wholesale sale of natural gas sold by them. Copies of this complaint were duly served on defendants-respondents on October 14, 1938. On the same date this Commission, on its own motion, ordered an investigation to determine whether the rates of said companies were unjust and unreasonable and if so, fix just and reasonable rates therefor. The rates in question have a substantial effect on the cost of gas to ultimate consumers in Chicago and the surrounding area, as the bulk of the natural gas sold by defendants-respondents is delivered to the Chicago District Pipeline Company, which, in turn, supplies all the natural gas used by utilities serving the area.

On November 16, 1938, the defendant-respondent companies filed their answer to the complaint. On April 14, 1939, this Commission entered an order consolidating the complaint case and the investigation for purposes of hearing. Thereafter, hearings were begun on May 8, 1939, and continued from time to time until October 6, 1939, during which a total of approximately 6000 pages of testimony was taken. Fifty-seven witnesses appeared and testified for the defendants-respondents and offered in evidence 135 exhibits. On October 6, 1939, in response to a question by the Trial Examiner, counsel for the defendants-respondents stated of record that the companies had concluded direct testimony in support of their case. Thereafter, beginning on October 23, 1939, the witnesses of the companies who had testified on the specific subject of rate of return were cross-examined by counsel for the two commissions for a period of twelve days and testimony of two witnesses on the subject of rate of return was then presented by counsel to this Commission and testimony of two witnesses on the same subject was offered of record by counsel for the Illinois Commerce Commission.

2852 At the conclusion of the direct testimony on November 7, 1939, counsel to both commissions joined in filing a written motion for an interim order reducing the rates and charges of the defendant-respondent companies. Copies of said motion were duly served upon defendants-respondents. At that point in the proceedings the hearings had extended over fifty-five days, approximately 8000 pages of testimony had been taken, and, in addition to the witnesses and exhibits heretofore mentioned as being submitted on behalf of the companies, six witnesses had testified and approximately forty-five exhibits had been introduced of record by the Illinois Commerce Commission and the staff of this Commission.

Subsequent to the service of the motion for an interim order reducing rates upon defendant-respondent companies, hearings were held beginning November 27, 1939, and extending through December 12, 1939, during which period of time counsel for defendants-respondents cross-examined at length the witnesses of both commissions who had testified on the subject of rate of return and in addition there was presented redirect and rebuttal testimony by said companies.

On December 18, 1939, after notice upon all interested parties, oral argument on the motion for an interim order was held before the Commission sitting en banc. This argument occupied a full day and was participated in at length by counsel representing the defendants-respondents, the Illinois Commerce Commission, and this Commission. Thereafter, briefs were filed by counsel representing all parties interested in the proceedings.

On December 19, 1939, we entered an order reconvening these proceedings for hearing to be commenced on January 8, 1940, so that the defendant-respondent companies might have further opportunity to present additional rebuttal testimony dealing with the issue of a proper rate of return and also to afford them opportunity to cross-examine one of the Commission witnesses who had previously given redirect testimony. The order fixing this hearing also granted defendant-respondent companies twenty days after the conclusion thereof within which to file briefs. Hearings were held on January 8, 9, and 10, 1940, at which time defendant-respondent companies presented of record additional rebuttal and redirect testimony. Although briefs were due to be filed on January 30, 1940, counsel for said companies requested a thirty-day extension of time within which to file their briefs and by order of this Commission, dated January 23, 1940, an extension of time for the filing of defendant-respondent briefs was given to February 15, 1940.

It is not the purpose of this memorandum opinion to deal exhaustively with every minute question involved in these proceedings. Suffice it to say that this matter is presently before us on the joint motion of counsel to this
Commission and the Illinois Commerce Commission
2853 filed November 7, 1939, for an immediate interim
order fixing just and reasonable rates for the interstate sale of natural gas for resale made by defendants-respondents. The record now before us is over 10,000

pages in length and over 200 exhibits have been introduced therein.

The motion does not set out specifically the amount of reduction which is requested. It does, however, allege that a fair rate of return for the defendant-respondent companies is not more than 6 to 6½ per cent. It also sets out alleged net earnings of the companies on various bases which exceed a 6 per cent return by from approximately $3,250,000 to approximately $4,110,000 and which exceed a return of 6½ per cent by from $2,870,000 to approximately $3,770,000. The brief of the Illinois Commerce Commission requests an order reducing rates by not less than $3,500,000. The brief of counsel to this Commission requests that rates be reduced at least by an amount of from $3,370,000 to $3,725,000.

The motion for an interim order alleges that the evidence before the Commission now clearly establishes that the present rates of the defendant-respondent companies are unjust and unreasonable and it is prayed that an immediate order be entered fixing just and reasonable rates. The defendants-respondents have filed a plea to the jurisdiction of the Commission in reply to the motion and a conditional answer thereto. We observe that all counsel have dealt exhaustively with the problems here involved and their briefs have been of material assistance to us.

Contentions of the defendant-respondent companies may be summarized as follows: (a) that the companies are private in character; that this Commission has no jurisdiction to regulate them; and that the Natural Gas Act, in so far as it attempts to give this Commission power to regulate the companies, is unconstitutional; (b) that the Commission has no jurisdiction under the Natural Gas Act to enter the interim order sought by the motion now pending before us until all the companies' witnesses have been cross-examined by counsel to the Illinois commission and to this Commission and shall have been examined on redirect, and until this Commission and the Illinois commission shall have presented all their witnesses and such witnesses have been cross-examined and the companies have offered rebuttal testimony; (c) that the Natural Gas Act confers upon this Commission no power or jurisdiction to enter the order sought; and (d) that the Commission is without authority to entertain the motion for

an interim order since the Illinois commission has no power to appear before this Commission, and counsel to this Commission have no power to make the motion since their action in doing so places the Commission in the position of "litigant or movant before itself sitting in its quasi-judicial and quasi-legislative capacity," and any action taken by this Commission under such circum-
2854 stances would violate the rights of defendants-respondents under the Fourteenth Amendment to the United States Constitution.

In addition, the defendants-respondents state that a finding of unreasonableness of rates at this time would violate the companies' rights under the Fourteenth Amendment, deny the conclusions contained in the factual allegations set out in the motion for interim order (however, there is no denial at any place of the facts themselves which are set out in the motion), and conclude that there is sharp conflict as to numerous issues of fact and law which cannot be determined at this time.

Counsel to this Commission ask that for the purpose of disposing of the motion for an interim order we accept the following:

(1) *The companies' estimate* of the life of their source of supply, to-wit: 23 years, 1932 to 1954, inclusive.

(2) *The companies' claim* that they will go out of business when this specific source of supply is exhausted.

(3) *The companies' book figures* for capital expenditures to date.

(4) *The companies' estimate* of the total gross capital expenditures over the period 1932 to 1954, inclusive.

(5) The highest present rate base figure for the companies' actual properties *testified to by the companies' witnesses.*

(6) *The companies' estimate* of revenue and operating expenses for the next few years embracing the reasonably immediate future.

It is to be noted that counsel to this Commission state in their brief:

"With respect to each one of these basic matters, it is our position that evidence already in the record or yet to be introduced by Commission witnesses indi-

> cates facts much more favorable to the consumers of gas than the Companies' evidence on these points. Nevertheless, as stated, we propose that the Commission accept the foregoing matters exactly as testified to by the Companies' witnesses."

The motion presently before us poses the question: Can we, upon the record at this time, determine just and reasonable rates to be hereafter observed by defendant-respondent companies and fix the same by order?

The fundamental problem concerning our ability to fix just and reasonable rates upon the record now before us involves answers to these questions: (a) Has this Commission jurisdiction? (b) Have the constitutional requirements of due process been met, namely, has a full and fair hearing been afforded defendants-respondents? (c) Can we grant the relief prayed in the motion for an interim order at this interlocutory stage in the proceedings? (d) Assuming that (a), (b), and (c) are answered in the affirmative, from a substantive standpoint, upon the record before us, what are just and reasonable rates to be observed by defendants-respondents and to be fixed by order of this Commission?

2855 The Commission has Jurisdiction.

At the threshold of this discussion let us dispose of the claim of defendants-respondents that we are without authority to regulate the rates involved herein because their business is contractual and private in character. This contention is without merit. The companies are engaged in the interstate transmission and sale of natural gas for resale for ultimate public consumption. Congress has determined that such business is affected with a public interest. Moreover, in line with well-settled doctrine, we determined in our opinion in re *Mississippi River Fuel Corporation*, Docket No. G-150, that contracts such as here involved must yield to regulation.

Section 4(a) of the Natural gas Act provides:

> "All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable,

and any such rate or charge that is not just and reasonable is hereby declared to be unlawful."

This section requires that rates and charges be just and reasonable and declares that *any such rates that are not just and reasonable are unlawful.* Section 5(a) provides that:

> "Whenever the Commission, *after a hearing* * * * *shall find that any rate* * * * or contract affecting such rate * * * *is unjust, unreasonable,* unduly discriminatory, or preferential, *the Commission shall determine the just and reasonable rate,* charge, classification, rule, regulation, practice, or contract *to be thereafter observed* and in force, *and shall fix the same by order* * * *." (Emphasis supplied.)

Due Process has been Afforded Companies.

On reviewing the entire proceedings before us, it is obvious that defendants-respondents have had a full and fair hearing.[1] The record discloses the companies have been accorded and have properly taken advantage of every opportunity to present all reasonably essential evidence that they desired with respect to every factor bearing on both the jurisdictional and substantive aspects of the problem before us. Moreover, they have had full opportunity to present oral argument and file briefs and in fact have made unmistakably clear their position with respect to every single issue involved in these proceedings.

2856 It is quite apparent that the defendant-respondent companies have presented all evidence that they deemed pertinent upon the question of fairness and reasonableness of their rates. The record discloses that throughout the hearings the Trial Examiner was extremely liberal in permitting the introduction of evidence by the companies. Moreover, the companies have had a full opportunity, which they have exercised, to cross-examine all witnesses offered so far by counsel to either commission and to offer all rebuttal testimony in explanation and clarification which they desired with respect to the testimony of such witnesses. They have had full opportunity, which they have exercised, to develop whatever facts they chose on redirect examination of such of their witnesses as have been cross-examined. However, they cannot be heard to complain that they have not yet been able to examine on redirect their own witnesses who have not yet been cross-examined, nor is it essential to a full hearing on the motion before us that they be permitted to cross-examine or rebut witnesses who have not yet been offered by counsel for the commissions.

---

[1] It is interesting to note that prior to the commencement of proceedings before this Commission the companies involved herein were engaged in substantially similar proceedings before the Illinois Commerce Commission. Some time during 1936 and 1937 the Illinois commission instituted an investigation against Chicago District Pipeline Company, which purchased substantially ninety per cent of the gas sold by the defendants-respondents. In February, 1938, the companies involved in this proceeding intervened in the proceeding before the Illinois Commerce Commission and participated in those proceedings although they did not offer affirmative evidence therein. During the pendency of the proceeding before the Illinois commission, the Natural Gas Act was passed. Thereafter, the Chicago District Pipeline Company and the companies involved herein, then interveners in the proceeding before the Illinois commission, moved that commission to suspend its proceedings on the ground that under the Natural Gas Act the jurisdiction to pass upon, and if necessary, regulate the prices and charges for natural gas sold at wholesale by the companies became vested exclusively in the Federal Power Commission.

The record amply supports our conclusion that the defendant-respondent companies have had a full and fair hearing. We are satisfied that the constitutional requirements of due process have been met. Our view finds complete support in the *New England Divisions Case*, 261 U. S. 184, wherein various western carriers asserted that the action of the Interstate Commerce Commission was void in increasing the divisions or shares of the New England carriers in joint through freight rates by fifteen per cent and, correlatively, decreasing the amounts received from the joint rates by carriers operating west of the Hudson River.[2] One of the principal grounds on which the western carriers rested their claim that the action of the Interstate Commerce Commission was void was stated by the Court as follows:

> "It is asserted that the order directs a transfer of revenues of the western carriers to the New England carriers, pending a decision in the matter of divisions; that Congress has not granted authority to take such provisional action; and that, hence, the

---

[2] The applicable sections of the Transportation Act, Section 1(4) and Section 15(6), dealing with just and reasonable divisions of rates and the power of the Interstate Commerce Commission to prescribe just and reasonable divisions when, after full hearing, the existing divisions were unjust or unreasonable, closely parallel Sections 4(a) and 5(a) of the Natural Gas Act.

order is void. The argument is, that under Section 15(6), the Commission may prescribe divisions only when, upon full hearing, it is of opinion that those existing are, or will be, unjust unreasonable or inequitable; that in such event it shall prescribe divisions which are just, reasonable and equitable; and that the provisional character of the order demonstrates that the hearing has not been a full one. Whether a hearing was full, must be determined by the character of the hearing, not by that of the order entered thereon. A full hearing is one in which ample opportunity is afforded to all parties to make, by evidence and argument, a showing fairly adequate to establish the propriety or impropriety, from the standpoint of justice and law, of the step asked to be taken. The commission recognized, and observed, these essentials of a full hearing."

2857 The Supreme Court upheld completely the order of the Interstate Commerce Commission. Whether a full hearing was granted depended not on the order entered by the Commission but on the character of the hearing, the Court stating:

> "There was thus ample time for, and every carrier was, in fact, afforded the opportunity of, introducing any and all evidence it desired.
>
> * * * * *
>
> "A hearing may be a full one, although the evidence introduced does not enable the tribunal to dispose of the issues completely or permanently; and although the tribunal is convinced, when entering the order thereon, that, upon further investigation, some changes in it will have to be made."

We deal only briefly with the contention of defendant-respondent companies that we are without authority to entertain the motion because there is a fatal defect of parties having authority to present and prosecute the motion now before us. The Illinois Commerce Commission is a "State commission" as defined in Section 2(8) of the Natural Gas Act. As such, it is entitled, in our opinion, to file the complaint presently before us and to make the request set forth in the motion for interim order. To conclude that counsel to this Commission are unable to join in the motion would be to subscribe to a paralysis of the administrative process not consonant with the duties involved in the administration of the Act. Therefore, we cannot agree that there is a fatal defect of parties before us which precludes us from acting upon the motion.

Interim Order Justified.

Having found that the defendant-respondent companies have been afforded a full hearing, let us turn to the question: Are we without authority to grant the affirmative relief prayed for in the motion for an interim order? An examination of the motion and record before us discloses that the movants do not call upon us to exercise power similar or comparable to that granted by the New York and Pennsylvania statutes to the regulatory bodies in those States whereby they may prescribe temporary rates upon the basis of much less evidence than that deemed to be necessary for the determination of final rates and wherein each of those commissions is authorized to prescribe a return upon a rate base to yield not less than a specific per cent fixed by statute, namely, five per cent.[3] Under the New York and Pennsylvania statutes there is no necessity for a full hearing with respect to determination of a fair rate of return for the purpose of prescribing temporary rates. In contrast thereto, in the instant proceedings, there has been a full and fair hearing upon the issue of a fair rate of return and there is an acceptance by the movants, for the purpose of this motion, of the testimony of defendants-respondents of the *"highest present rate base figure for the Companies'* 2858 *actual properties testified to by the Companies' witnesses," together with the companies' estimates of revenue and operating expenses, the life of their source of supply of natural gas, book figures for capital expenditures to date, the total gross capital expenditures over the period 1932 to 1954, inclusive, and other factors essential in presently determining the problem before us.*

It is obvious, therefore, that we are not called upon to perform a function comparable to that delegated by the statutes of New York and Pennsylvania to the regulatory bodies of those States. We are, however, implored to recognize an unpalatable situation, and to apply thereto the affirmative grant of authority delegated to us by the

---

[3] **Section 114 of the Public Service Law of New York and Section 310 of the Pennsylvania Utility Act.**

Congress under Sections 4(a) and 5(a) of the Natural Gas Act which plainly require that interstate wholesale rates and charges for natural gas be just and reasonable and declare that *any such rates that are not just and reasonable are unlawful.* In fact, there is a definite direction in Section 5(a) to the effect that if, after hearing, we find any rate or contract affecting a rate to be unjust or unreasonable, *we "shall determine the just and reasonable rate, charge," etc., "and shall fix the same by order."* Thus, the most casual reading of the Act, in the light of its broad purposes, negatives the idea that we are inhibited from granting the relief sought by the motion for an interim order and forcibly emphasizes the duty of this Commission to grant such relief when, as in the instant case, from a factual standpoint, the record is ripe for the application of the express provisions of the Act.

There are those who will be rendered unhappy by the frustration of their ambition to maintain the excessive rates presently charged by defendant-respondent companies. But to refuse a substantial reduction thereof would require us to sit, aloof from reality, and permit unlawful rates to exist without affording those suffering thereby any relief. Inaction on our part would indicate that we had fallen into a mental trap not in keeping with our responsibilities.

2859 The Assumed Rate Base.

The defendant-respondent companies claim a rate base computed as follows:

Reproduction Cost New exclusive of Gas Reserves	$56,302,250
Less "Viewed" Depreciation	2,866,758
Present Value of Physical Properties exclusive of Gas Reserves	$53,435,492
Present Value of Gas Reserves	$13,334,775
Allowance for Future Capital Expenditures	6,046,286
Going Value	8,500,000
Working Capital	975,000
Total	$82,291,553

For the purpose only of disposing of the problem presented by the motion before us, we reluctantly accept the companies' estimate of reproduction cost, their claimed present value of gas reserves, and also their claim for working capital. We cannot, however, even for the purpose of an interim order, accept the full claim for future capital expenditures or the amount sought for going value. It is our opinion, because of the use of the sinking fund method of amortizing the entire investment, which we are presently approving for the purpose of this motion, no deduction from the companies' estimate of reproduction cost new is being made for depreciation. It is generally agreed that where the sinking fund method of depreciation is employed (amortization of investment is used in the instant case in lieu of depreciation and depletion), an undepreciated rate base is proper.[4]

It is contended by the companies that during the period from June 1, 1939, to December 31, 1954, when they estimate their sources of gas supply will be exhausted, they will expend for capital improvements the total sum of $9,145,083. However, this entire sum is not claimed as a part of the rate base but only $6,046,286 thereof is sought by applying the principle of average investment. Obviously, the improvements have not yet been made. They are contemplated in the future. It is clear, therefore, that such improvements are not used and useful in the present and to a certain extent must be deemed conjectural. We agree that in fixing rates for the future reasonable estimates of property additions in the immediate future should be taken into consideration. We are of the opinion that the estimate of additions for the period June 1, 1939 to December 31, 1942, is ample for the purpose of disposing of the motion now before us. The companies' estimate for this period is $3,808,399. This amount we allow.

2860 The companies' claim of $8,500,000 for going concern value must be disallowed. The amount obviously is an arbitrary claim, not supported by substantial evidence warranting its allowance. Its allowance would mean the acceptance of a deceptive fiction, resulting in an unfair imposition upon consumers. We are convinced that we are allowing in our rate base more than an adequate amount to cover all elements of value.

---

[4] See *Telephone and Railroad Depreciation Charges*, 177 I. C. C. 351, 410; *Los Angeles Gas and Electric Co. v. Railroad Commission of California*, 289 U. S. 287, 298.

In disposing of the motion for interim order, we are accepting at this time the companies' estimates of

Reproduction Cost New of Physical Properties (exclusive of Gas Reserves)	$56,302,250
Value of Gas Reserves	13,334,775
Capital additions for the period June 1, 1939 to December 31, 1942	3,808,399
Working capital	975,000
Total Rate Base	$74,420,424

The foregoing amount allowed as a rate base may be compared with book cost of properties, plus working capital of $975,000, as of December 31, 1939, totalling $60,952,279, and therefrom it is clearly disclosed that the rate base presently allowed herein is liberal. This appears especially true when the period of construction is taken into consideration.

Amortization.

The companies have introduced evidence relating to the amortization of the investment in, or claimed value of, their properties. Ordinarily, depletion and depreciation are recognized items of expense of natural gas producing and transmission companies, but because of the alleged very limited life of the gas supply in these proceedings, amortization is claimed, and is allowed, in lieu thereof. Evidence was introduced by the companies, as well as by counsel for the Commission, relative to the sinking fund method of amortization and, for our present purposes, we will accept that method.

The defendants-respondents claim that the present fair value, including estimated value of estimated future capital additions, should be amortized over the remaining estimated life of the gas reserves available to them. We believe that the total investment, in contradistinction to claimed fair value, should be amortized and that the amortization period should be the total estimated life of the business, namely twenty-three years, rather than the remaining life, fifteen years.

The amounts of amortization are recognized and treated as operating expenses. Operating expenses are stated on

the basis of cost. There is no more reason to compute amortization expense on the basis of the fair value or reproduction cost of property than there is to substitute fair value of reproduction cost for all other expenses, such as labor, materials and supplies, etc. In our opinion, the method allowed will, with proper management, return the companies their full and complete investment in their properties by the time their business is estimated to
2861 end, with adequate compensation on the claimed fair
value of the properties (less the disallowances mentioned above) in the interim. We refuse to make an allowance of amortization in excess of cost. To do so would not be the computation of a proper expense, but instead the allowance of additional profit over and above a fair return. Manifestly such an additional return would unjustly penalize consumers.

The amortizable investment is the total investment estimated to be made during the life of the companies, less the salvage value at the end thereof. For the purpose of disposing of the motion before us we accept the claim of the companies that this investment will amount to $78,284,009, inasmuch as the amount subject to amortization is the total investment during the life of the enterprises, it follows that the amortization period should be the same period, namely twenty-three years (from 1932 to 1954).

The record discloses that evidence was introduced showing the applicability of the sinking fund method of amortization to the facts herein. The companies claim the interest rate in the sinking fund formula should not exceed two per cent. However, we feel that 6½ per cent should be used. Where an interest rate lower than the allowed rate of return is used, unjust enrichment of the companies at the expense of the consumers is a most likely result. Under the sinking fund method, consumers are given no credit by way of a reduced rate base for the amortization expense

2862

Rate of Return.

The record before us clearly discloses that a great amount of testimony was devoted to the question of rate of return. There has been extensive and detailed cross-examination of all witnesses who testified specifically on the subject on behalf of the companies and both commissions. The defendants-respondents have also had a full opportunity, of which they have availed themselves, to present redirect and rebuttal testimony on this phase of the case. In addition, briefs of all counsel have dealt quite exhaustively with the subject.

It is, of course, beyond the practical scope of this opinion to analyze all the exhibits and testimony dealing with this subject. There is abundant evidence disclosing that we are today at a point where rates of return demanded are among the lowest that have ever existed. The exhibits put into evidence by practically every witness show that today over-all returns and yields are lower than before. Ample evidence of record indicates that the companies would have no difficulty in financing at a low cost if they restricted their securities to a proper amount, with reasonable ratio of bonds, preferred and common stock. There is substantial evidence of record indicating that the companies could finance on as favorable a basis, if not a more favorable basis, than any natural gas producing and transmission company in the United States. There is testimony of record indicating in this connection that with earnings of 6.2 per cent to 6.5 per cent a sound pipeline company could easily finance on a basis of 40 per cent bonds, 20 per cent preferred stock, and 40 per cent common stock, with yield or return to the public of 3.5 on the bonds, 5.75 per cent on the preferred and 8 per cent on the common stock. The cost of money to such company would be 3.75 per cent for the bonds, 6.10 per cent for the preferred, and 10 per cent cost of floating the common stock. On such basis of financing, the interest coverage would be 4.68 times.

From the law we know that we are required to fix rates which will permit the companies to earn a fair return. From an examination of the law we can also determine the essential basic general elements that we must consider in determining what is a fair rate of return. However, the application of these principles to a concrete case such as the matter before us requires the application of our judgment to all the facts as we find them in the record.

Fundamental statements respecting the general principles applicable in ascertaining what is a fair rate of return may be found in *Bluefield Waterworks & Improvement Co.* v. *Public Service Commission of West Virginia*, 262 U. S. 679, where the Court stated, at page 692:

> "What annual rate will constitute just compensation depends upon many circumstances and must be deter-

> mined by the exercise of a fair and enlightened judgment, having regard to all relevant facts. A public
> utility is entitled to such rates as will permit it to
> 2863 earn a return on the value of the property which it
> employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties. A rate of return may be reasonable at one time and become too high or too low by changes affecting opportunities for investment, the money market and business conditions generally."

It is interesting to note that the defendants-respondents do not ask that we find a *fair rate of return* but assert "a minimum of eight per cent should be allowed defendants as a just and reasonable return on the value of their property." An expert for the Illinois Commerce Commission testified that a fair return for these companies "did not exceed six per cent." The brief of counsel to this Commission states that "the fair rate of return is six per cent,—and in no event should it exceed 6½ per cent."

Suffice it to say that we have carefully considered the testimony of record relating to the problem of fixing a fair rate of return, contentions of all parties interested in these proceedings, and in the light of the Bluefield case conclude, for the purpose of disposing of the motion before us, that 6½ per cent is a fair annual rate of return upon the rate base allowed.

Conclusion.

The following table shows the results of our conclusions stated above:

Income available for amortization and return		$9,362,032
Less amortization		1,557,852
Income available for return		$7,804,180
Rate base	$74,420,424	
Rate of return	6.5%	
	$ 4,837,328	$4,837,328
Available for reduction in net revenues		$2,966,852
Consequent reduction in Federal Income Taxes		783,909
Total Available for Rate Reduction		$3,750,761

The record herein, in view of the foregoing, impels us to the further conclusion that rates and charges presently charged by the defendant-respondent companies are unjust, unreasonable, unlawful, and violative of the provisions of the Natural Gas Act. Therefore, until further order of this Commission, and in keeping with the requirements of Section 5(a) of the Act, we presently determine for the purpose of disposing of the motion before us that the just and reasonable rates, charges, etc., to be hereafter observed by said companies and fixed by order of this Commission shall reflect an immediate reduction of at least $3,750,000. The Commission feels that a reduction of this amount is conservative in view of the acceptance of the companies' estimates and the generous allowances made throughout.

Before concluding, it is to be noted that the acceptance by us, for the purpose of disposing of the motion for
2864 an interim order (and for that purpose only), of reproduction cost testimony presented by the defendant-respondent companies will not inhibit us from subsequently exercising our judgment as to how reproduction cost evidence shall be ultimately treated herein.

An appropriate order embodying its findings of fact will be entered in accordance with this opinion.

ORDER REDUCING RATES.

Having considered the complaint of the Illinois Commerce Commission against, the answer thereto by, and the order of this Commission instituting investigation of, the Natural Gas Pipeline Company of America and the Texoma Natural Gas Company, defendants-respondents herein, a motion of counsel for the Illinois Commerce Commission and counsel for this Commission for an immediate interim order reducing rates, the conditional answer and pleas to jurisdiction in reply thereto by defendants-respondents, the other orders previously entered herein, the evidence of record, the oral arguments presented before the Commission sitting en banc and the briefs filed herein, and having on this date made and entered its Memorandum Opinion

(Opinion No. 49) which is hereby referred to and made a part hereof by reference:

The Commission, for the purpose of disposing only of the joint motion before it for an immediate interim order reducing rates, in the above entitled matters, finds that:

(1) The Natural Gas Pipeline Company of America is a corporation organized and existing under the laws of Delaware; is engaged in the transportation of natural gas in interstate commerce by means of its 24-inch natural gas main transmission pipe line, approximating 900 miles in length, extending from a point in the State of Oklahoma known as Gray's Junction through the States of Kansas, Nebraska, and Iowa, and into the State of Illinois to a point near Joliet; is also engaged in the sale in interstate commerce of natural gas so transported to various purchasers for resale for ultimate public consumption for domestic, commercial, industrial, and other uses; and is a "natural-gas company" within the meaning of the Natural Gas Act;

(2) The major portion, approximating 90%, of the natural gas transported and sold by the Natural Gas Pipeline Company of America is sold to the Chicago District Pipeline Company, for resale for public consumption, delivery being made near Joliet, Illinois;

(3) The Texoma Natural Gas Company is a corporation organized and existing under the laws of Delaware; is engaged in the production and gathering of natural gas in the Texas Panhandle field; is engaged in the transportation of natural gas in interstate commerce by means of its 24-inch natural gas main transmission pipe line, approximating 75 miles in length, extending from its compressor station in the State of Texas near Fritch into the State of Oklahoma to its sales meter and connection, near Gray's Junction, with the system of the Natural Gas Pipeline Company of America; is also engaged in the sale in interstate commerce of gas so transported to the Natural Gas Pipeline Company of America for resale for ultimate public consumption for domestic, commercial, industrial, and other uses; and is a "natural-gas company" within the meaning of the Natural Gas Act;

(4) The major portion, approximating 90% of the natural gas so produced and gathered by the Texoma

Natural Gas Company, is transported and sold by it to the Natural Gas Pipeline Company of America at the aforesaid delivery point near Gray's Junction, Oklahoma;

(5) The Illinois Commerce Commission is a "State commission" within the meaning of the Natural Gas Act;

(6) The rates and charges, demanded, observed, charged, and collected by the Natural Gas Pipeline Company of America and the Texoma Natural Gas Company, defendants-respondents herein, for the transportation and the sales of natural gas in interstate commerce, set forth in findings Nos. (1) to (4), inclusive, together with the rules, regulations, practices, and contracts, affecting such rates and charges, are subject to the jurisdiction of this Commission;

2866 (7) The Natural Gas Pipeline Company of America and Texoma Natural Gas Company, defendants-respondents, are under substantially common control and ownership, are but arms of the same organization, being virtual departments of the same, and are in all substantial respects operated as a single enterprise, for the production, gathering, transportation, sale, and delivery of natural gas;

(8) Until further order of this Commission and for the purpose of disposing of the motion before us, a rate base composed of the Companies' estimates may be accepted, as follows:

Reproduction Cost New of Physical Properties (exclusive of gas reserves) as of June 1, 1939	$56,302,250
Value of Gas Reserves as of June 1, 1939	13,334,775
Capital Additions from June 1, 1939, to December 31, 1942	3,808,399
Working Capital	975,000
Rate Base	$74,420,424

(9) The total capital expenditures of the Companies through December 31, 1954, less salvage (including all capital expenditures to date), based upon the Companies' estimates, will be not more than $78,284,009, which is the amount on which provision for amortization should be calculated;

(10) The period over which the provision for amortization should be calculated is the entire life of the properties, estimated by the Companies to be 23 years, 1932-1954, inclusive;

(11) The annual allowance for amortization should be calculated on a sinking fund basis, with interest credited to the amortization reserve at the rate of 6½% per year, compounded annually;

(12) The required annual allowance for amortization is $1,557,852;

(13) The fair rate of return for the Companies is not more than 6½% per annum;

(14) The annual amount necessary for a fair return to the Companies is not more than $4,837,328, which, with the addition of the annual allowance of $1,557,852 for amortization in (12) above, amounts to a total of $6,395,180, for amortization and a fair return;

(15) The Companies' annual net revenues available for amortization and return, based upon the Companies' estimates, averaged for 1939 to 1942, inclusive, will be $9,511,454, which will be reduced to approximately $9,362,032 as a result of the calculated increase in Federal taxes under the 1940 Revenue Act;

(16) The Companies' annual net revenues (as found in (15) above) available for amortization and return, exceed the amount reasonably necessary as found in (14) above, by $2,966,852;

(17) A reduction in annual net revenues of $2,966,852, together with the consequent reduction in the applicable Federal Income Tax, would permit a reduction in rates (gross operating revenues) of $3,750,000;

(18) The rates and charges made, demanded, or received by defendants-respondents for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption are unjust, unreasonable and excessive;

(19) The rates and charges of defendants-respondents, after reflecting the reductions hereinafter ordered, will be just and reasonable;

Therefore, the Commission orders that:

(A) The rates and charges made, demanded, or received by defendants-respondents for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption shall be reduced to reflect a reduction of not less than $3,750,000 per annum in the operating revenues of Natural Gas Pipeline Company of America;

(B) Defendants-respondents shall file on or before August 15, 1940, new schedules of rates and charges for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption, which shall reflect the reduction in operating revenues ordered in paragraph (A) above, which new schedules of rates and charges shall be effective as to all bills regularly rendered on or after September 1, 1940;

2867 (C) The Commission reserves the right to reject all or any part of such new schedules and in lieu thereof to prescribe the same by further order;

(D) On and after the effective date of the new schedules of rates and charges filed and made effective in accordance with paragraph (B) above, defendants-respondents shall cease and desist from making, demanding, or receiving any rates and charges which do not reflect the reduction ordered in paragraph (A) above;

(E) The record herein shall remain open for such further proceedings as the Commission may deem necessary or desirable;

(F) The motion by defendants-respondents to dismiss the motion for immediate interim order reducig rates for want of jurisdiction be and the same is denied;

(G) The motion by defendants-respondents to dismiss the motion for immediate interim order reducing rates for want of sufficient evidence of record be and the same is denied;

(H) This order shall not be construed as an acquiescence by this Commission in any estimates or determinations of original cost, or any valuation of property, claimed or asserted by said defendants-respondents.

By the Commission.

Leon M. Fuquay,
Secretary.

MOTION FOR A STAY OF THE COMMISSION'S ORDER OF JULY 23, 1940.

To the Honorable Federal Power Commission:

Now comes Natural Gas Pipeline Company of America and Texoma Natural Gas Company, defendants-respondents in the above entitled and numbered causes, and move the Commission to enter and issue an order staying and suspending the effective date and the operation of its order dated July 23, 1940, and served on defendants-respondents on August 1, 1940, ordering and directing defendants-respondents to file on or before August 15, 1940, new schedules of rates and charges for or in 2870 connection with their transportation and sale of natural gas in interstate commerce which shall reflect a reduction in operating revenues of Natural Gas Pipeline Company of America of not less than $3,750,000.00 per annum.

The grounds upon which this motion is based and presented follow.

I.

Defendants-respondents, in good faith and with diligence and expedition, are engaged in preparing a motion for rehearing on the issues decided adversely in the memorandum opinion of the Commission upon which said order dated July 23, 1940, is based, and in said order itself. Said motion for rehearing, in due course and within the time required under the Natural Gas Act, will be filed with the Commission and will be presented and urged in good faith before the Commission.

II.

Serious and substantial questions of law and of fact have been raised and presented by defendants-respondents

in the proceedings before the Examiner herein and in the pleadings and briefs filed and submitted in reply to the motion for interim order, in pursuance of which the Commission entered its said order dated July 23, 1940. Reference is here made to the transcript of the evidence in the above entitled and numbered causes and to the several exhibits offered and received in connection therewith; to the answer of defendants in said cause No. G-109 filed November 18, 1938; to defendants-respondents' pleas to the jurisdiction of the Commission dated December 18, 1939, in reply to said motion for an interim order; to the
2871 conditional answer of defendants-respondents dated
December 18, 1939, in reply to said motion for interim order filed by complainant and counsel for the Commission; to defendants-respondents' memorandum brief dated December 18, 1939, in support of their pleas to the jurisdiction of the Commission to enter an interim order pursuant to motion of complainant, Illinois Commerce Commission, and counsel for the Commission; and to defendants-respondents' memorandum brief dated February 15, 1940, in reply to briefs of complainant and counsel for the Commission. Said transcript, exhibits, pleadings and briefs are all on file with and in the hands of the Commission, and same are by reference expressly made a part of this motion. An examination of said transcript, exhibits, pleadings and briefs to which we have just referred discloses affirmatively that serious and substantial questions of law and of fact have been and are in good faith presented on behalf of defendants-respondents to the Commission, many of which issues have been by the Commission resolved adversely to the position and contention of the defendants-respondents thereon. Defendants-respondents in their motion for rehearing, to be filed in due course as aforesaid, will point out and assign the various errors committed by the Commission in its adverse ruling on said several issues of law and of fact.

III.

In their motion for rehearing defendants-respondents will point out and assign as error on the part of the Commission its holdings, rulings and findings on the several issues resolved adversely to the defendants-respondents by the Commission in its said opinion and order, including the following:

2872 1. In holding that defendants-respondents' business is affected wiht a public interest and is subject to regulation under the Natural Gas Act;

2. In holding that it has authority under the Natural Gas Act to enter an interim order pending the final conclusion of the hearing now pending before the Commission and its Examiner;

3. In holding that defendants-respondents have had a full and fair hearing within the meaning of the Natural Gas Act and the Fifth Amendment to the Constitution of the United States;

4. In holding that the claim of defendants-respondents for $8,500,000.00 for going concern value as a part of the rate base is an arbitrary claim not supported by substantial evidence warranting its allowance, and in refusing to allow such going concern value, which defendants-respondents insist is established by uncontradicted evidence;

5. In reducing the allowance in the rate base for future capital expenditures, which under the uncontradicted evidence must be incurred, from $9,145,083.00 to $3,808,399.00;

6. In holding that the rate base claimed by defendants-respondents in the amount of $82,291,553.00 should be reduced to $74,420,424.00;

7. In holding that the amount to be amortized should be reduced from $84,341,218.00, as claimed by defendants-respondents, to $78,284,009.00;

8. In holding that the amount to be amortized should be the investment cost and not the fair value of the property at the present time;

2873 9. In holding that the period over which provision for amortization should be calculated is the entire maximum life of the properties, namely, 23 years, beginning January 1, 1932, and ending sometime prior to December 31, 1954;

10. In not holding that the period over which provision for amortization should be calculated is the period beginning with the present time and extending over the remaining life of the properties;

11. In holding that the annual allowance for amortization should be calculated on a sinking fund basis, with interest credited to the annual allowance for amortization reserve at the rate of 6½% per annum, compounded annually;

12. In not holding that interest on the annual allowance

should be calculated at not more than 2%, compounded semi-annually, which, as shown by the uncontradicted evidence, is the most that defendants-respondents could earn by investing the annual accruals for amortization in the highest types of income-bearing securities;

13. In holding that if a rate of return of 6½% is fair and equitable for defendants-respondents, the same rate would be fair and equitable in computing the amortization to be charged as an operating expense under the sinking fund formula;

14. In holding that the required annual allowance for amortization is only $1,557,852.00;

15. In not holding that the required annual allowance for amortization is at least $4,849,620.00;

16. In finding that a fair rate of return for de-
2874 fendants-respondents on the present fair value of
their properties, erroneously fixed at the sum of
$74,420,424.00, is not more than 6½% per annum;

17. In not finding that the fair rate of return is at least 8% per annum;

18. In holding in effect that defendants-respondents are entitled to no more than the actual cost of refinancing their properties, with no compensation for the enterprise, skill in design and construction, and extraordinary management through which defendants-respondents' properties have been operated at extraordinarily high pressures and stresses and an extraordinarily high load factor, which enterprise, skill in design and construction and extraordinary management account for a very substantial portion of defendants-respondents' reveues and earnings;

19. In finding and holding that the annual amount necessary for a fair return to defendants-respondents is not more than $4,837,328.00;

20. In holding that the defendants-respondents' present annual revenues available for amortization and return exceed the amount reasonably necessary by the sum of $2,966,852.00;

21. In finding that the rates and charges received by defendants-respondents from the sale of natural gas in interstate commerce for resale for ultimate public consumption are unjust, unreasonable and excessive;

22. In finding that the rates and charges of defendants-respondents after reflecting the reductions ordered will be just and reasonable;

23. In not holding that the burden of proof rests 2875 upon complainant and counsel for the Commission to establish that defendants-respondents' existing charges are unjust and unreasonable, and that they have not discharged such burden;

24. In not holding that when and if complainant and counsel for the Commission discharge their burden of showing that defendants-respondents' rates and charges are unjust and unreasonable, the burden was then upon complainant and counsel for the Commission to show what rates would be just and reasonable, and that they have not discharged such second burden;

25. In denying the pleas of defendants-respondents to dismiss the motion for immediate interim order reducing rates for want of sufficient evidence;

26. In making no allowance in the annual expense and cost of operations to cover replacements of capital assets during the future life of defendants-respondents' business;

27. In ordering that the rates and charges by defendants-respondents for natural gas sold in interstate commerce for resale for ultimate public consumption be reduced to reflect a reduction of not less than $3,750,000.00 per annum in the operating revenues of Natural Gas Pipeline Company of America;

28. In ordering that defendants-respondents file on or before August 15, 1940, new schedules of rates and charges for and in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption which shall reflect a reduction in operating revenues of $3,750,000.00, which new sched-
2876 ules of rates and charges shall be effective as to all bills regularly rendered on and after September 1, 1940;

29. In ordering that on and after the effective date of the new schedule of rates and charges defendants-respondents shall cease and desist from making, demanding or receiving any rates and charges which do not reflect the reduction ordered as aforesaid.

By enumerating the above mentioned holdings, findings and orders of the Commission, defendants-respondents do not waive, but expressly reserve, the right to point out and assign as error other holdings, findings and orders of the Commission in the motion for rehearing which defendants-respondents will prepare and file in due course as aforesaid.

Defendants-respondents will not here undertake to present their arguments in support of their position and contention that the holdings, findings and orders above mentioned are erroneous. Their position has been made clear to the Commission in the transcript, exhibits, pleadings and briefs filed with the Commission and by reference made a part of this motion as aforesaid. The contentions and arguments of defendants-respondents on said several issues set forth in the transcript, in the exhibits, in the pleadings, and in the briefs above referred to are here adopted and by reference reiterated in all things as if repeated here.

IV.

Even if it be assumed that under the terms of the Natural Gas Act the Commission has authority to 2877 regulate and fix the charges of defendants-respondents for natural gas sold in interstate commerce under the circumstances reflected by the record herein, and if it be assumed that a full and fair hearing has been accorded defendants-respondents and that there is substantial evidence warranting a finding by the Commission that the existing rates charged by defendants-respondents for natural gas are unjust and unreasonable (all of which defendants-respondents deny), the Commission is without authority to reduce the existing rates, fixed by private contracts negotiated prior to the enactment of the Natural Gas Act, to a level which will not enable and permit defendants-respondents to recover, during the remaining life of defendants-respondents' business, the present fair value of defendants-respondents' property devoted to public use, together with a reasonable return thereon. Defendants-respondents do not concede that the rate base allowed by the Commission is proper, or that 6½% per annum on a proper rate base constitutes a fair and reasonable return to defendants-respondents, in the light of this record; but, if it be assumed that the rate base allowed is proper, and that 6½% per annum is a reasonable and fair rate of return, the Commission's order dated July 23, 1940, operates to confiscate and take defendants-respondents' property without due process of law, in violation of the Fifth Amendment to the Constitution of the United States, in that, under the operation of the order, defendants-respondents are precluded absolutely from ever

recovering, during the remaining life of their project, as found by the Commission for the purposes of this order, the present fair value of their property through the accumulation of adequate reserves for amortization,
2878 the accruals allowed by the Commission being entirely inadequate.

V.

Feeling themselves aggrieved and very substantially damaged by the operation of said order, defendants-respondents have the right, which they will exercise, of preparing and presenting to the Commission a motion for rehearing, to be filed within thirty days from the service on defendants-respondents of such order. After the filing of such motion for rehearing, the Commission has thirty days within which to consider such motion for rehearing and enter an order sustaining or denying it. Should the Commission deny such motion for rehearing and refuse to abrogate its order, defendants-respondents have the right, which they will exercise, to a review of such order by the Circuit Court of Appeals of the United States for the circuit wherein defendants-respondents have their principal place of business or by the United States Court of Appeals for the District of Columbia. In their petition for appeal defendants-respondents will seek a review of all the holdings, findings and orders of the Commission adverse to the contentions of defendants-respondents clearly set forth herein and in the transcript, exhibits, pleadings and briefs by reference made a part of this motion, and any other adverse holdings, findings and orders of the Commission not here specifically pointed out but which defendants-respondents shall present to the Commission in their motion for rehearing to be filed herein as aforesaid.

VI.

If the order dated July 23, 1940, be not stayed and
2879 its operation be not suspended pending the filing of defendants-respondents' motion for rehearing and the proceedings of the Commission on such motion and pending the review of the order by the courts, defendants-respondents will sustain serious, substantial and irreparable damages and losses in this:

1. The operation of the order will deprive defendants-

respondents of revenues aggregating $312,500.00 per month which defendants-respondents would otherwise receive if the present rates continue in force during such period pending the filing and disposition of the motion for rehearing and the review of the order on appeal. Should the order be abrogated by the Commission upon consideration of defendants-respondents' motion for rehearing or by the court upon its review in due course of such order, the revenues of which defendants-respondents will have been deprived up to the time of the abrogation of such order will have been forever lost to defendants. Neither the Commission nor the court could make provision for the recouping by or reimbursement to defendants-respondents of the very substantial losses which defendants-respondents will have sustained. No provision is contained in the Natural Gas Act authorizing the Commission or the court to order such recouping or reimbursement, and defendants-respondents would be without means of recovering or recouping such losses as a result of further rate proceedings or otherwise. Defendants-respondents, therefore, are without protection against the irrevocable loss of the amount represented by the reduced
2880 revenues, during the period pending consideration
by the Commission of the motion for rehearing and the review of the order by the courts, except by declining to observe the order during such period, in which event they might be prosecuted under the severe penal provisions of Section 21 of the Natural Gas Act. Said Section 21 provides that any person who wilfully and knowingly does, or causes, or suffers to be done, any act, matter or thing in the Natural Gas Act prohibited or declared to be unlawful shall, upon conviction thereof, be punished by a fine of not more than $5,000.00 or imprisonment for not more than two years, or both. It also provides that any person who wilfully or knowingly violates any rule, regulation, restriction, condition or order imposed by the Commission under authority of the Act shall, in addition to other penalties, be punished, upon conviction, by a fine of not exceeding $500.00 for each and every day during which such offense occurs. Without admitting that they would be subject to such severe penalties under the circumstances confronting them, defendants-respondents respectfully urge that they should not be put to the alternative of accepting the reduction of their revenues in a

very substantial amount each month as above pointed out, with no hope of recovery of their losses should the order be abrogated as the result of their motion for rehearing or their petition to the courts for review, or of defying the order of the Commission and thus taking the risk of becoming subject to the severe penalties in fines and imprisonment under the penal provisions above mentioned should the order ultimately be upheld.

2881 2. No express provision is contained in the Natural Gas Act for relief by appeal to any court for a stay of the operation of the order until after the denial of the motion for rehearing and the filing of a petition for review under Subdivision (b) of Section 19 of the Act. If the Natural Gas Act be construed as denying defendants-respondents the right to a review by a court of competent jurisdiction of the refusal of the Commission to stay the operation of its order dated July 23, 1940, and if the Natural Gas Act be construed as purporting to authorize the Commission to enforce said order pending the filing and disposition of the motion for rehearing, then the Natural Gas Act itself is null and void in so far as it purports to authorize the enforcement of the order during such period in that it would operate to deprive defendants-respondents of the right to a judicial review and to judicial relief against the injuries and damages they would sustain by reason of the operation of the order during the period pending the final disposition by the Commission of the motion for rehearing, in violation of the due process clause of the Fifth Amendment to the Constitution of the United States. Likewise, the order itself, for the same reasons, would be null and void in so far as it would operate to reduce the revenues of defendants-respondents during the period pending the filing and disposition of the motion for rehearing; and any effort by the Commission to enforce the provisions of the order requiring defendants-respondents to reduce their rates and charges during such period would result in an unconstitutional administration of the Natural Gas
2882 Act, in violation of the due process clause of the Fifth Amendment to the Constitution.

3. No such emergency exists as would justify subjecting defendants-respondents to the peril of losing their revenues in the substantial amounts above stated or of taking the risk of subjecting themselves to the severe

punishment and penalties under the provisions of Section 21 of the Natural Gas Act. In this connection defendants-respondents point out that in the complaint of the Illinois Commerce Commission filed herein and in the opinion of the Commission it was observed that the rates and charges of defendants-respondents have a substantial effect on the cost of gas to ultimate consumers who purchase gas from those to whom defendants sell gas at wholesale for resale; and it is manifest that the ultimate objective of the Commission and the underlying objective of the Congress in the enactment of the Natural Gas Act was and is to secure for the ultimate consumers fair and reasonable rates for natural gas. However, even if the order of the Commission ultimately be upheld, defendants-respondents point out to the Commission that no advantage can possibly accrue to such ultimate consumers by reason of enforcing the rates and charges set up by the order of the Commission dated July 23, 1940, during the period pending the disposition of defendants-respondents' motion for rehearing by the Commission and the review of the order by the courts. Until the motion be finally disposed of and, if the motion for rehearing be not granted, until the termination of the proceedings on appeal to the courts for a review of the Commission's order, no state commission or
2883 other regulatory body would be warranted in reducing rates to the ultimate consumers because of the reduced charges ordered by the Commission until it be finally determined that such reduced prices and charges are valid and enforcible. The practical effect, therefore, of the order and the reduction in defendants-respondents' revenues resulting from the operation of the order, pending the disposition of the motion for rehearing and the review by the court, would be to deprive defendants-respondents of the amount represented by the reduction in their prices and charges and transferring said sums, not to the ultimate consumers, but to the purchasers at wholesale from defendants-respondents under contracts approved and executed by such purchasers, none of whom is complaining of defendants-respondents' rates and charges.

4. No public interest will be served by requiring defendants-respondents to pay over sums aggregating $312,-500.00 a month during the period pending the disposition of the motion for rehearing by the Commission and the review of the order by the courts to the distributing com-

panies which purchase defendants-respondents' gas at wholesale and which are not here complaining that defendants-respondents' rates and charges are unjust and unreasonable.

Wherefore, defendants-respondents pray that the operation of the order dated July 23, 1940, be stayed and suspended pending the filing by defendants-respondents of their motion for rehearing and the disposition of such motion by the Commission and, in the event the motion for rehearing be denied, pending the review of said
2884 order by the courts on appeal.

OBJECTIONS OF ILLINOIS COMMERCE COMMISSION TO GRANTING OF RESPONDENTS' MOTION FOR STAY OF COMMISSION'S ORDER OF JULY 23, 1940.

To the Honorable Federal Power Commission:

Now comes the Illinois Commerce Commission by its Attorney, John E. Cassidy, Attorney General of the State of Illinois, complainant in the above entitled cause, Docket Number G-109, and moves the Commission to deny the application of respondents for an order staying and suspending the effective date and operation of its order dated July 23, 1940.

2886

I.

Defendant-respondents are afforded ample opportunity to file their petition for rehearing before the effective date of the order on September 1, 1940.

II.

Defendant-respondents admit that their grounds for contending that the Commission's order of July 23, 1940 is invalid are already set forth in their briefs, pleadings, arguments and evidence filed with the Commission.

III.

Defendant-respondents' allegation that they will assign as error Points 1 to 30 contained on pages 4 to 8 inclusive of said motion afford no ground for the granting of a stay order since this paragraph in effect constitutes a petition for rehearing. Furthermore respondent states on page 8 that its position has already been made clear to the Commission in its affidavit, pleadings and briefs. As the Commission has rejected these contentions after a careful and deliberate consideration of these issues, no basis for granting respondents' motion for a stay has been made out.

IV.

Defendant-respondents' allegations that the Commission is without authority to reduce existing rates; that they do not concede that the rate base is proper; that 6½% does not constitute a fair and reasonable return; that defendant-respondents will be precluded from recovering the 2887 fair value of the property; that the order of July 23rd operates to confiscate and take respondents' property without due process of law; do not constitute any reason for granting a stay order as the Commission's order on its face demonstrates that respondents are assured of an adequate and fair return on a rate base in excess of their investment.

V.

Defendant-respondents' allegation that it proposes to seek a review of the Commission's order of July 23, 1940 in the Circuit Court of Appeals does not constitute ground for a stay order as it may apply to such court for a stay of the order of the Commission.

VI.

The allegation that the order will deprive respondents of $312,500.00 per month of revenues is not ground for granting of the stay order in view of the fact that the record shows that the respondents have been charging excessive and illegal rates in excess of those amounts for the past several years.

The order of the Commission sets forth in finding 15 that for the period of 1939 to 1942, the net revenues of the company available for amortization and return will average $9,362,032 annually; in finding 14, that the amount necessary for fair return and amortization is $6,395,180.00, such fair return being computed on the company's reproduction cost appraisal; in finding 16 that said net revenue will 2888 permit a reduction in net revenues of $2,966,852 or gross revenue of $3,750,000. If the Commission had used the Company's own investment as the rate base, or 6% as a fair return, the excessive return would have been found by the Commission to have aggregated much more than $3,750,000.00. The Commission itself has found that its order is conservative in view of the acceptance of the Company's estimates and the generous allowances made by the Commission throughout the order.

Wherefore, we pray that the application for a stay order be denied.

Illinois Commerce Commission,

ORDER GRANTING IN PART AND DENYING IN PART A MOTION FOR A STAY OF THE COMMISSION'S ORDER OF JULY 23, 1940.

Upon application filed with the Commission on August 8, 1940, by Natural Gas Pipeline Company of America and Texoma Natural Gas Company, praying that the operation of the Commission's order dated July 23, 1940, in the above entitled matter, be stayed and suspended pending the filing of a motion for rehearing and the disposition of such motion and, in the event such motion be denied, pending the review of said order by the courts on appeal;

The Commission orders that:

(A) Paragraph (B) of the Commission's order adopted July 23, 1940, in this proceeding be and it is hereby amended to extend the time of filing of new schedules of rates and charges to on or before September 1, 1940;

(B) The application of Natural Gas Pipeline Company of America and Texoma Natural Gas Company, referred to above, be and it is hereby denied except as provided in paragraph (A) above.

By the Commission.

APPLICATION FOR REHEARING.

To the Honorable Federal Power Commission:

Now come Natural Gas Pipeline Company of America and Texoma Natural Gas Company, defendants-respondents in the above entitled and numbered causes, hereinafter referred to as applicants, and apply for a rehearing on the order of the Commission dated July 23, 1940, and served on applicants on August 1, 1940, and for an order vacating and abrogating said order. The grounds upon which this application is based are stated specifically in the assignments of error, hereinafter set out, 2892 directed to certain rulings, holdings and findings in the proceedings leading up to the order, in the memorandum opinion on which the order is based, and in the order itself. Applicants insist that each of such assignments presents material error; and that the order based on such erroneous holdings, rulings and findings operates to deprive applicants of valuable and substantial rights and property, in violation of the due process clause of the Fifth Amendment to the Constitution of the United States, and of the Natural Gas Act, with the inevitable result that applicants will sustain damages aggregating many millions of dollars.

In their pleadings, their statements to the Examiner in the course of the hearing of evidence, their oral argument before the Commission, and their briefs heretofore filed with the Commission, applicants have fully presented to the Commission their positions and contentions on the issues raised by the assignments of error. The statement of applicants' counsel to the Examiner, Record pp. 30-43, the answer of defendants in cause No. G-109 filed November 18, 1938, defendants' pleas to the jurisdiction of the Commission dated December 18, 1939, defendants' conditional answer to the motion for interim order filed December 18, 1939, defendants' memorandum brief dated December 18, 1939, and defendants' reply brief dated February 15, 1940, all on file with the Commission, are by reference made a part of this application for rehearing. In the interest of brevity applicants will not repeat the arguments submitted orally and in their briefs or undertake to cite and discuss here the authorities sustaining the positions, contentions and arguments of applicants on the issues 2893 presented by the assignments of error, except in a few instances where applicants feel that some elaboration may assist in pointing out the effect of the error assigned. We wish to make it clear, however, that we are receding from our position on none of the issues presented by the assignments of error, but in support of the position of applicants on the issues raised by the assignments adopt and urge the arguments applicable to such issues heretofore presented by counsel for applicants in their oral arguments and in their briefs.

Assignments of Error.

First.

The Commission erred in holding that it has authority under the Natural Gas Act to change, modify or set aside the charges and prices at which applicants are selling natural gas in interstate commerce at wholesale, it appearing from the record without contradiction that applicants, constituting a single enterprise, are engaged in the business of owning natural gas reserves in the State of Texas, developing such reserves through the drilling and equipping of wells thereon, producing natural gas therefrom in quantities equal to three-fourths of their total market requirements, purchasing gas from others in quantities equal to one-fourth of their market requirements, transporting the gas so produced and purchased through their own pipelines and facilities to points in the States of Kansas, Nebraska, Iowa and Illinois, and selling such commodity at wholesale to selected distributors and industrial consumers under private contracts; that their business is of a strictly private character, not affected with a public interest in the sense that Congress would have jurisdiction, power or authority to enact legislation purporting to authorize the Commission to regulate the charges or prices for which such commodity is sold; and that the necessary operation of any order purporting to reduce, change or modify such charges would deprive applicants of their property and liberty of contract without due process of law, in violation of the Fifth Amendment to the Constitution of the United States. (Commission's memorandum opinion No. 49, p. 9; Commission's order reducing rates, finding No. 6, p. 3.).

2894 The point urged in the above assignment of error was raised in Paragraph 7 of defendants' answer in cause No. G-109 filed November 18, 1938, and again in Section I of defendants' pleas to the jurisdiction of the Commission dated December 18, 1939. However, the point was not discussed in the oral argument before the Commission or in the briefs filed with the Commission since it is directed at the Natural Gas Act itself in so far as said Act by its terms may be held to be an attempt to confer on the Commission authority to reduce the prices charged by applicants for natural gas sold at wholesale under private contracts. The Commission has no power or jurisdiction to decide an issue going to the constitutionality of an act of Congress, although it has undertaken to do so in its opinion and order to which this application is directed. The point was saved by applicants in their pleadings and in their briefs, to be presented, if necessary, to the courts, which have the exclusive jurisdiction to decide the issue raised.

Second.

The Commission erred in overruling defendants' second plea to the jurisdiction of the Commission dated December 18, 1939, and in holding that it has jurisdiction under the Natural Gas Act to reduce the prices at which applicants are selling natural gas, by interim order or otherwise, pending the final termination of the proceedings and hearing now pending before the Commission and its Examiner, and pending a finding by the Commission, after the conclusion of the hearing and after applicants have had an opportunity to be heard on their briefs and arguments on the facts presented by the whole record and the law applicable thereto, that the rates and prices charged and collected by applicants are unjust, unreasonable, unduly discriminatory or preferential. (Commission's memorandum opinion No. 49, pp. 10-13.)

2895 It will be noted that there is no formal finding among those contained in the order reducing rates going to the issue raised by this assignment. However, the

Commission, in its memorandum opinion, pp. 10-13, held contrary to the position urged by applicants in the assignment of error. Applicants raised the issue in Section II of defendants' pleas to the jurisdiction of the Commission dated December 18, 1939, and urged the point in their memorandum brief dated December 18, 1939, pp. 4-27, and in their reply brief dated February 15, 1940, pp. 32-43. The position of applicants in such pleas and in their briefs in substance was and now is that the rates and charges of applicants are prima facie valid and that the Commission is without jurisdiction to reduce such rates and charges until the hearing now pending before its Examiner shall have been finally completed and closed and until applicants have had an opportunity to be heard in their briefs and arguments on the facts presented by the whole record and the law applicable thereto and until the Commission shall then find that the rates and prices charged and collected by applicants are unjust and unreasonable.

We have pointed out that the motion for interim order was filed in the midst of the hearing then in progress before the Examiner. We point out now that we are still in the midst of that hearing. Thirty witnesses who testified for applicants have not been cross examined. The complainant and counsel for the Commission have offered no evidence except that going to the question of rate of return. Applicants have had an opportunity to cross examine the four witnesses who testified on behalf of complainant and the Commission on rate of return. Complainant and 2896 counsel for the Commission have stated that they will cross examine the other witnesses who testified for applicants and that they will present witnesses who will testify to facts going to the issues raised by the testimony submitted by applicants. Before applicants can be held to have had a hearing within the meaning of the Natural Gas Act the cross examination of applicants' witnesses must have been concluded; applicants must have been given an opportunity to offer redirect testimony by these same witnesses after they have been cross examined; applicants must have heard the testimony of those who will testify adversely and they must be given an opportunity to cross examine those witnesses; and applicants must be given an opportunity to offer rebuttal testimony in reply to the testimony of witnesses whom the complainant and counsel for the Commission will present at the hearing.

There is no contention by complainant or counsel for the Commission that the pending hearing has reached that stage where it can be closed. They have urged as a reason for an interim order the circumstance that many months will be required to complete the hearing. It is significant that the Commission in its memorandum opinion, page 11, states, "the companies have had a full opportunity, which they have exercised, to cross-examine all witnesses offered so far by counsel to either commission and to offer all rebuttal testimony in explanation and clarification which they desired with respect to the testimony of such witnesses." But a hearing within the meaning of the Natural Gas Act requires that applicants be given an opportunity to cross-examine all witnesses to be offered hereafter by counsel 2897 for either Commission and to rebut the testimony of such witnesses. Prospective delay in the orderly processes of justice is no justification for a denial of due process of law. Certainly the delay in this instance is not chargeable to applicants, who, an examination of this record will disclose, were required to present their testimony within a period much shorter than that ordinarily required for the presentation of such a volume of testimony of the character of that presented by this record. The complaint and investigation had been pending some fourteen or fifteen months when the last session of the hearing was concluded on January 10, 1940. Neither the complainant nor counsel for the Commission was ready to proceed with any testimony except that going to the question of a proper rate of return. Had counsel for the two Commissions been as diligent as were applicants in the preparation of their testimony, this hearing could have been completed and closed long prior to the expiration of the time required by the Commission to consider the application for interim order.

Third.

The Commission erred in holding that under the Natural Gas Act it has power and jurisdiction to enter an interim order pending the final termination of the hearing now pending and an opportunity by applicants to be heard by brief and oral argument on the law and the facts presented by the whole record, since no such power or jurisdiction is conferred upon the Commission by the Natural Gas Act, either in express terms or by necessary implication. (Commission's memorandum opinion No. 49, pp. 10-13.)

In Section III of defendants' pleas to the jurisdiction of the Commission dated December 18, 1939, applicants raised the point stated in the third assignment of error;
and in Points II, III, IV, V and VI of defendants'
2898 memorandum brief dated December 18, 1939, pp. 28-
82, and in defendants' reply to briefs and argument of complainant and counsel for the Commission dated February 15, 1940, pp. 32-43, applicants urged, and we think demonstrated, that there is no statutory authority empowering the Commission to enter an interim order pending the closing of the hearing now in progress, and in the absence of such statutory authority the Commission is without jurisdiction or power to enter such an order reducing applicants' rates. We demonstrated also that the jurisdiction and power to enter the interim order suggested in the motion cannot be read into the Act under the rule of contemporary construction; that the Commission has no power except that specifically conferred by the statute in express terms or by necessary implication; and that the words "after hearing" contained in the Natural Gas Act cannot be construed as authorizing the entering of any finding that prices and charges of applicants are unjust and unreasonable pending the final conclusion of the hearing now in progress.

Fourth.

The Commission erred in holding that in these proceedings applicants have had a hearing within the meaning of Section 5(a) of the Natural Gas Act, which provides that "whenever the Commission, after a hearing * * * shall find that any rate, charge, * * * is unjust, unreasonable, * * * the Commission shall determine the just and reasonable rate, charge, * * * and shall fix the same by order." (Commission's memorandum opinion No. 49, pp. 10-13.)

The issue presented by the fourth assignment is clearly raised in Sections II and III of defendants' pleas to the jurisdiction of the Commission dated December 18, 1939;
Section I of defendants' conditional answer dated
2899 December 18, 1939; and it is presented and urged in
Point VI of defendants' memorandum brief dated December 18, 1939, pp. 76-82, and in defendants' reply brief dated February 15, 1940, pp. 32-43. We remind the Commission that in their original brief counsel for complainant did not rely on the New England Divisions case

as authority for the interim order. On the other hand, they relied on cases arising in states in which there is special statutory provision for temporary orders with special provision for a recoupment of the difference in the temporary rate and the rate finally fixed should the rate finally fixed exceed the temporary rate. They also cited cases from the Oklahoma Supreme Court which, as we have already pointed out, are entirely out of line with the authorities in all other states. We demonstrated that the line of cases first cited in support of the motion for interim order are authority, not for the granting of the motion, but to the contrary. Counsel for the two Commissions then sought to fall back on the New England Divisions case and the Commission cites the latter case as authority for the order.

As we pointed out in our original memorandum brief (pp. 76-78) and in our reply brief (pp. 32-35), the New England Divisions case is not in point. If the hearing in the present case were now completed and if the oral arguments and briefs on the whole record, rather than half or less than half of it, had been presented, if the case had been submitted by all parties, and if the order were based on the whole record with a reservation that after further investigation in the light of the whole record the order might be changed or modified by the Commission, then the
New England Divisions case would be in point; but
2900 there is nothing in the New England Divisions case
warranting the conclusion that it is authority for the
procedure here, where the motion for interim order was entertained and the order entered in the very midst of the hearing.

Fifth.

The Commission erred in denying the request of applicants that the issues of fact and of law raised by the motion on which the Commission's order of July 23, 1940, is based and by the briefs in support thereof be referred to the Examiner for a very careful analysis and consideration after receiving briefs and oral argument from counsel for the interested parties, and that the Commission have the formal recommendations of the Examiner on the issues, both of fact and of law, and the exceptions of applicants thereto, if any, before the Commission should consider the entering of an interim order reducing applicants' revenues.

Applicants have repeatedly urged the point that the issues of fact and of law presented by the record should be referred to the Examiner, who heard the witnesses testify and observed the demeanor of the witnesses while on the witness stand, who was present when the statistical and technical exhibits were identified and explained by the witnesses, and who followed the explanations of the exhibits, many of which consisted of charts, graphs and drawings of a highly technical character and tabulations of figures which were practically meaningless unless accompanied by explanations by those who prepared the figures.

Applicants further urged that the Examiner prepare a report, accompanied by his recommendations, going to the issues of fact and of law presented by the record, and that applicants be furnished with a copy of the report in order that they might file and present their exceptions thereto before the Commission should consider the entering of an order based on such report and recommendations.

2901 Perhaps the Commission did refer the record to its Examiner. We do not know. Perhaps the Examiner did make a report accompanied by recommendations to the Commission. We do not know. Perhaps the Commission acted upon such recommendations and entered its order in pursuance thereof. We do not know. Perhaps it rejected the report and recommendations in whole or in part and entered an order inconsistent with such report and recommendations as a whole. We do not know. But applicants are entitled to know the facts concerning the procedure between the Commission and the Examiner. The denial by the Commission of applicants' request that the usual open procedure be followed is reversible error, if not indeed a denial of due process of law. It seems perfectly clear that the Commission would not be in position to accept or reject the Examiner's report in whole or in part without itself, through the personnel of the Commission and not through representatives, reading every line of the testimony reflected by the transcript and exhibits submitted in connection therewith. Perhaps the members of the Commission have discharged their responsibility in this connection by reading and studying every line of the testimony and the exhibits submitted in connection therewith and, without inviting any suggestion by applicants or offering applicants any opportunity to be heard on the Examiner's report or recommendations, have accepted or re-

jected such report and recommendations in whole or in part and proceeded on their own responsibility to make their findings and holdings set forth in the Commission's memorandum opinion and order reducing rates. Even if they have pursued that course, applicants have been denied due process of law. The testimony should be heard
2902 by the trier of the facts. This is of special importance in a proceeding of this character where it is so difficult to follow the testimony from a mere reading of the transcript.

Had the Commission followed the usual procedure and directed the Examiner to make a report accompanied by recommendations and caused a copy of such report and recommendations to be delivered to applicants, the issues to be determined by the Commission could have been narrowed down to those on which applicants disagreed with the report and recommendations of the Examiner. On these issues, after hearing counsel on arguments supporting their exceptions, the Commission could have examined the record and passed upon such exceptions in an orderly way which would have constituted due process. Valuable rights are involved here, and we respectfully urge that the process through which the Commission has arrived at the drastic results reflected by its order should have been made known to applicants prior to the entering of the order and that applicants should have been given reasonable opportunity to be heard prior to the entering of the order.

The Commission observes on page 10 of its memorandum opinion that applicants have had full opportunity to present oral argument and file briefs and have in fact made unmistakably clear their position with respect to every single issue involved in these proceedings. The fact is, this record shows that applicants have never been heard in oral argument on the facts involved in this proceeding. They appeared at Washington on December 18, 1939, at the only hearing held before the Commission itself during the entire progress of these proceedings. Their
2903 counsel announced that they were not prepared to present an oral argument on any questions except those involved in the several pleas to the jurisdiction of the Commission to enter an interim order. The reasons stated for their finding themselves in that position show clearly that they did not have an opportunity to present oral argument on the facts or on the law going to any other questions than those raised by the pleas to the

jurisdiction. It is true they were permitted to file a brief and that they did file a brief on February 15, 1940, embracing some 404 pages, in which they undertook to discuss the issues of fact and of law presented by the record. However, they were not given as much time as they stated to the Commission they would require in order properly to brief the questions involved, and even if they had had all the time they requested they could not have presented in their brief, with that clarity with which they could have presented their views before the Examiner, who had heard the witnesses testify and had followed them in their tedious explanations of the numerous exhibits presented in connection with their testimony, the arguments going to the question of a proper rate of return, which question the Commission, with no substantial evidence to sustain its finding, erroneously has resolved against applicants.

In applicants' memorandum brief and in their reply brief they have cited numerous authorities supporting the contention here made. These authorities include *Ohio Bell Telephone Co.* v. *Public Service Commission,* 301 U. S. 292, 81 L. E. 1093; *Morgan* v. *U. S.,* 298 U. S. 468, 80 L. E. 1288; *Morgan* v. *U. S.,* 304 U. S. 1, 82 L. E. 1129; and *Wisconsin Telephone Co.* v. *Public Service Commission,* 287 N. W. 122.

2904

Sixth.

The Commission erred in not holding that the burden of proof rests upon complainant and counsel for the Commission to establish that applicants' existing charges are unjust and unreasonable, and that such burden has not been discharged.

Seventh.

The Commission erred in not holding that when and if complainant and counsel for the Commission discharged their burden of showing that applicants' rates and charges are unjust and unreasonable, the burden was then upon complainant and counsel for the Commission to show what rates and charges would be just and reasonable, and that such second burden has not been discharged.

The Commission in its memorandum opinion and its order ignored the issues raised in the sixth and seventh assignments of error. In the very beginning of these proceedings applicants urged that the burden of proof rests upon the complainant and counsel for the Commission to establish that applicants' existing charges are unjust and unreasonable and that after they shall have discharged that burden, if they ever do, the burden will still rest upon them to show what rates and charges would be just and reasonable. That they have not discharged either of these burdens goes without saying, for they have made no attempt to discharge such burdens. We have presented this question in the oral statement of counsel shown at pages 30-42 of the transcript and in defendants' reply brief dated February 15, 1940, pp. 27, 43-96, and 378-391.

Eighth.

The Commission erred in finding that the rates and charges presently charged by applicants are unjust,
2905 unreasonable, unlawful and violative of the provisions of the Natural Gas Act. (Commission's memorandum opinion No. 49, p. 26; Commission's order reducing rates, finding No. 18, p. 4.)

Applicants have made their position on this point clear in their reply brief dated February 15, 1940, at pages 43-96, 378-391. We adopt the argument there presented. The succeeding assignments of error and the comments submitted in support of such assignments apply to and are adopted and urged in support of this assignment.

Ninth.

The Commission erred in establishing the following rate base:

Reproduction cost new of physical properties (exclusive of gas reserves as of June 1, 1939)	$56,302,250
Value of gas reserves as of June 1, 1939	13,334,775
Capital additions from June 1, 1939, to December 31, 1942	3,808,399
Working capital	975,000
Rate base	$74,420,424

(Commission's memorandum opinion No. 49, p. 19; Commission's order reducing rates, finding No. 8, p. 3.)

Tenth.

The Commission erred in not allowing as the proper rate base the items and amounts set out in defendants' reply brief dated February 15, 1940, p. 251, as follows:

2906 Reproduction cost new exclusive of gas reserves	$56,302,250
Less "viewed" depreciation	2,866,758
Present value of physical properties exclusive of gas reserves	$53,435,492
Present value of gas reserves	13,334,775
Allowance for future capital expenditures	6,046,286
Going concern value	8,500,000
Working capital	975,000
Rate base	$82,291,553

Eleventh.

The Commission erred in not holding that the proper rate base is the present value of the property, which, under the uncontradicted evidence, is made up of the reproduction cost new less viewed or actual depreciation of the depreciable properties, the value of the gas reserves, the going concern value, the working capital, and a proper allowance for future capital expenditures aggregating $82,291,553. (Defendants' reply brief dated February 15, 1940, p. 251.)

Twelfth.

The Commission erred in attempting to apply its own theory as to undepreciated rate base by placing on the gas reserves the present value of those reserves in their depleted condition. (Defendants' reply brief dated February 15, 1940, pp. 144-161.)

With reference to the ninth, tenth, eleventh and twelfth assignments of error we point out that applicants have
never made the contention that the reproduction cost
2907 new of the physical properties other than leaseholds
represents the present value of such properties. In
conformity with the rule declared in *Smyth* v. *Ames*, 159

U. S. 466, 42 L. E. 819, and uniformly reaffirmed thereafter by the Supreme Court of the United States and other courts of last resort, we urge that the proper rate base is the present value of the property, including going concern value and working capital, now devoted to applicants' business, plus a proper allowance for future capital expenditures which the evidence shows without contradiction will be required during the remaining life of applicants' gas reserves in order to continue their business. No logic would justify fixing the present value of the depreciable properties other than leaseholds at the reproduction cost new thereof, with no deduction for depreciation that has already occurred in the properties of the existing plant, and then fixing on the gas reserves a valuation which in effect applies past depletion to the reproduction cost of such gas reserves. Yet that is exactly what the Commission has done in its findings and in its order. In weighing the reproduction cost new of the present properties, the Commission was required under the law to give effect to past depreciation and depletion of the present properties. The Commission seems to have become confused in the application of the rule that if the sinking fund formula be applied in computing the allowance for depreciation or amortization, an undepreciated rate base will be allowed. As we have demonstrated in defendants' reply brief dated February 15, 1940, pp. 172-181, that rule has nothing to do with the present depreciated and depleted condition of applicants' properties or with the deduction of past 2908 depreciation and depletion from reproduction cost new in arriving at present value. The rule has to do with future depreciation. Applicants' complaint is that the Commission has failed to allow the proper rate base in that it has failed to consider observed depreciation of the depreciable properties in the past and in that it has denied any allowance for going concern value or for capital expenditures after the year 1942, which, under the uncontradicted evidence, it must allow in arriving at the present fair value of applicants' properties.

The errors of the Commission in denying any allowance for going concern value and in denying any allowance for capital expenditures made after the end of the year 1942 will be specifically presented in succeeding assignments of error.

Thirteenth.

The Commission erred in making no allowance for going concern value in fixing the rate base and in fixing the amount to be amortized. (Commission's memorandum opinion No. 49, p. 19.)

Fourteenth.

The Commission erred in holding that the sum of $8,500,000 claimed by applicants as going concern value is an arbitrary claim not supported by substantial evidence, it appearing from the uncontradicted evidence that said sum of money represents the aggregate of expenditures actually made and costs actually sustained in developing the market outlets for applicants' gas up to the normal capacity of the lines; that such expenditures and costs were reasonable; and that at least that amount would have to be expended in attaching business if applicants were now at the beginning of their operations. (Commission's memorandum opinion No. 49, p. 19.)

2909 Notwithstanding the observations of the Commission in its memorandum opinion, we submit and again urge that applicants' claim for an allowance of $8,500,000 as going concern value is not an arbitrary claim, nor would its allowance mean the acceptance of a "deceptive fiction." It is supported by substantial evidence which is uncontradicted. The Commission says its allowance would result in an unfair imposition upon consumers. Our position is that its denial results in an unfair imposition on applicants in that it operates to confiscate this very substantial element of value which applicants have acquired as a part of the total value of their property at an actual cost greater than the amount claimed.

In their reply brief applicants have demonstrated that the courts for nearly a half century have held uniformly that going concern value must be considered and allowed in arriving at the present value of properties in fixing the rate base and in fixing the amount to be amortized. Only in those instances where the evidence fails to show the presence of going concern value have the courts upheld regulatory bodies which have denied an allowance for going concern value. It is true that the proving of going concern value has been fraught with difficulties. The result is that it has become the practical rule that this element of value will be allowed only in the amount which the evidence shows definitely to be represented by actual costs to the regulated concern during the period of development. Every item claimed by applicants is amply supported by proof that the costs representing the item claimed were actually incurred. In every instance, 2910 except that dealing with actual depreciation during the first four years of applicants' operations, the evidence shows without contradiction that the money was actually paid out of pocket by applicants as interest on money invested in facilities provided in advance of load, in ad valorem taxes on such facilities during the period of load building, and in expenditures actually made in promotional activities in loading the line.

The claim for depreciation in connection with this item represents the actual depreciation on the facilities not yet in use during the load building period. The method of arriving at these values is not subject to question and the figures themselves are not subject to contradiction. An examination of the authorities submitted by applicants in their brief shows that the amount claimed is not out of line with amounts allowed for this item in many adjudicated cases. As already pointed out, the case of *Southwestern Bell Telephone Co.* v. *City of Fort Smith*, 294 Fed. 102, is direct authority sustaining this claim and the method of developing the evidence supporting it.

Fifteenth.

The Commission erred in reducing the amount allowed for future capital expenditures from $6,046,286, as claimed by applicants, to $3,808,399, thus eliminating from the amount allowed all future capital expenditures after December 1, 1942, it appearing from the uncontradicted evidence that the amounts claimed by applicants for capital expenditures after the date last mentioned will certainly and definitely be made and that the property acquired through such expenditures will be devoted to applicants' business. (Commission's memorandum opinion No. 49, pp. 17, 18 and 19; Commission's order reducing rates, finding No. 8, p. 3.)

2911 The Commission in its memorandum opinion observed that the improvements referred to in this assignment have not yet been made; that they are contemplated in the future; and it then asserted that such improvements are not used and useful in the present and to a certain extent must be deemed conjectural. As a matter of fact, the record shows without contradiction that substantial expenditures would have been made prior to the present time. It is true that the others are contemplated in the future. It is also true that those additional assets not yet acquired are not used and useful at the present; but we challenge the statement that these improvements even to a certain extent, to quote the Commission's language, are conjectural. The testimony is clear and unequivocal that these figures represent, not additional capital expenditures which may have to be made, but expenditures which must be made in order to carry on applicants' business through the year 1954. The testimony that applicants' gas wells are losing pressure from month to month and that with the decline in pressure there is even a more rapid decline in the productive capacity of the wells is uncontradicted. That testimony is not conjectural; it is in conformity with common knowledge concerning the behavior of gas wells. There is no conjecture in the uncontradicted testimony that additional wells will have to be drilled in large numbers to overcome the loss in productive capacity incident to the decline in pressures. There is no conjecture in the testimony that pipelines will have to be built to each of these new wells, and that meters and regulators will have to be installed at each of said wells. There is no conjecture in the uncontradicted
2912 testimony that as the pressures decline it will be necessary to install field compressor stations in order to deliver gas into the initial main line compressor station in such quantities as to keep applicants' pipeline loaded to its normal capacity. The drilling of new wells, the building of pipelines to these wells, the installing of meters and regulators at these wells, and the installing of field compressor stations to service all wells, drilled and to be drilled, constitute the major portion of the additional capital expenditures. Substantial portions of the remaining amounts claimed in this connection are directly related to the drilling, equipping and operation of new wells and the building and maintaining of the additional pipelines and

compressor station facilities. The other items are supported by positive testimony based on studies which the record shows were thorough to the last detail. The uncontradicted testimony further shows that the figures are conservative and that many additional capital outlays will be required to cover contingencies which the witnesses could not yet certainly foresee at the time they testified.

The Commission agrees that, in fixing rates for the future, reasonable estimates of property additions in the immediate future should be taken into consideration. Applicants' complaint is that in applying that principle, which was developed in connection with the regulation of continuing or perpetual utilities, the Commission failed to take into account the difference in the situation of applicants and such continuing or perpetual utilities. Applicants are engaged in an extractive industry. When their source of supply is exhausted they will of necessity go out of business. It is necessary, therefore, 2913 to look ahead and to make provision for additional capital costs to the end that applicants' rights be protected before it is too late to protect them. These expenditures are made from year to year—indeed, from month to month. It is utterly impractical to go back to the Commission each month or even each year and ask for additional allowances in the rate base to cover these capital expenditures which inevitably will have to be made. As observed by the Commission, applicants have not sought an allowance of the total of these capital expenditures in the rate base, but are asking an allowance of substantially less than the total under the principle of average investment over the period to be covered by the new rate. We have covered the subject thoroughly in defendants' reply brief dated February 15, 1940, pages 206-221.

Sixteenth.

The Commission erred in holding that the total investment, by which it manifestly means original cost, in contradistinction to claimed fair value, less the salvage value at the end of applicants' business, should be amortized. (Commission's memorandum opinion No. 49, pp. 20 and 21.)

Seventeenth.

The Commission erred in holding that the proper amount to be amortized is $78,284,009. (Commission's memorandum opinion No. 49, p. 21; Commission's order reducing rates, finding No. 9, p. 3.)

2914

Eighteenth.

The Commission erred in not holding that the proper amount to be amortized is $84,341,218, representing the present fair value of applicants' present properties, including going concern value and working capital, plus future expenditures for additional capital assets, less the liquidating salvage value at the end of the project's life. (Commission's memorandum opinion No. 49, pp. 20-22.)

Applicants have discussed the questions raised in the sixteenth, seventeenth and eighteenth assignments thoroughly in defendants' reply brief dated February 15, 1940, pages 97-226. There we presented squarely to the Commission the proposition that, whatever the rule may be as to ordinary public utilities or industries under regulation at the beginning of operations, an unregulated industry, upon being placed under regulation for the first time by the operation of a statute, is entitled to amortization of the full fair value of its properties subjected to public use as of the time it is overtaken with regulation, including cost in the future of additional facilities. The soundness of this proposition is not open to question, as we view it. The Commission made no comment on this question or on the authorities submitted in support of applicants' position in respect thereto. We urge upon the Commission, therefore, that it carefully reconsider its holding on this point and that it compare the situation of applicants with that of an owner whose property is condemned and actually acquired through the exercise of the right of eminent domain. It has been held universally that in condemning the property of a private owner for public uses the owner must be compensated in the amount of the fair value 2915 of the property condemned. It is true that the operation of the Natural Gas Act is not to take the title to applicants' properties; but it is manifest that the character of that title is radically and materially changed. Applicants no longer have a property devoted to their own private enterprise of producing, purchasing, transporting and selling natural gas at wholesale at prices on which they can agree with their purchasers; but, if the Natural Gas Act be upheld, they now have a property which, not they, but the Congress, has dedicated to a public use and which they must now own and operate under the regulation of the Federal Power Commission, delegated by Congress to carry out the provisions of the Act. It was not the original cost of applicant's properties in 1931, 1932, and subsequent years which Congress dedicated to a public use. On the other hand, it was the property which applicants owned and were utilizing in the operation of their business which Congress so dedicated. If it be assumed that Congress has the power to lay hold on property devoted to the character of business in which applicants are engaged and, without their consent, change the character and use of that property by impressing it with a public interest, then the Congress must provide for a reasonable return on the value of that property and for a return, over the future life of applicants' business, of the value, not the original cost, of such property at the time its character is changed.

Nineteenth.

The Commission erred in holding that the proper amortization period should be the total estimated life 2916 of the business, namely, 23 years from the beginning of 1932 to the end of 1954. (Commission's memorandum opinion No. 49, pp. 20-21; Commission's order reducing rates, finding No. 10, p. 3.)

Twentieth.

The Commission erred in not holding that the proper amortization period should be the period intervening from the present time to the end of the project's life, which, under the uncontradicted evidence, will be sometime prior to December 31, 1954. (Commission's memorandum opinion No. 49, p. 20.)

The issues presented by the nineteenth and twentieth assignments of error are of the utmost importance in that the drastic effect of the Commission's error in disposing of these questions will inevitably result in the confiscation of many millions of dollars of the present value of applicants' properties affected by the Natural Gas Act. We have presented the question in defendants' reply brief, pages 226-237. It is our view that there is no escape from the position presented there.

When applicants' pipelines were constructed in 1930 and 1931 and when their operations commenced on January 1, 1932, they were not subject to regulation by any national or state commission or tribunal. Their business was a private enterprise, and it continued to be a private enterprise until the enactment and approval of the Natural Gas Act near the middle of 1938. Even if the Natural Gas Act be valid, they were not actually overtaken with regulation until August 1, 1940, the effective date of the Commission's order reducing rates. Prior to the date last mentioned the rates fixed between applicants and their purchasers at wholesale by private contracts 2917 continued to be valid and binding on all parties. Their earnings prior to the issuance of the first order of regulation were their own, and the Commission is without authority to prescribe the application of their earnings prior to regulation. Yet, in thus directing that the period of amortization begin on January 1, 1932, the Commission is attempting to impose retroactive regulation upon applicants and applicants' business, not from the time its first order affecting applicants was issued, or indeed from the date the Act became effective, but for a long period prior to either of such dates. Not only did the Commission attempt to give retroactive effect to regulation in its treatment of the subject of amortization; but in that attempt the Commission failed to take into account the uncontradicted evidence showing that the total net revenues before amortization and return in each of the years 1932, 1933 and 1934 were less than the amount allowed in the order for amortization and return.

In ordering that the period of amortization should continue through the entire remaining life of the field the Commission ignored the fact, established by the uncontradicted evidence and accepted by the Commission as true, for the purposes of the interim order, that during the last two years of applicants' operations, 1953 and 1954, the total earnings available for amortization and return, without deducting the $3,750,000 as ordered by the Commis-

sion, will be substantially less than the entirely inadequate amount allowed by the Commission for amortization and return. Indeed, Exhibit 142, which the Commission has accepted for the purposes of this order, shows that
2918 after deducting this $3,750,000 annually from the net revenues available for amortization and return there will not be a single year from 1943 to 1954 inclusive when applicants will earn the amount allowed for amortization and return.

Twenty-First.

The Commission erred in hoding that the annual allowance for amortization should be calculated on a sinking fund basis, with interest credited to the amortization reserve at the rate of 6½% per annum, compounded annually. (Commission's memorandum opinion No. 49, pp. 21-22; Commission's order reducing rates, finding No. 11, p. 3.)

Twenty-Second.

The Commission erred in not holding, under the uncontradicted evidence, that the annual allowance for amortization should be calculated on a straight line basis, or in any event on a sinking fund basis with interest credited to the amortization reserve at the rate of 2% per annum, compounded semi-annually. (Commission's memorandum opinion No. 49, pp. 21-22.)

Twenty-Third.

The Commission erred in holding that it is fair and equitable, in computing the amortization to be charged as an operating expense under the sinking fund formula, to use an interest rate of 6½%, the allowed rate of return. (Commission's memorandum opinion No. 49, pp. 21-22.)

Twenty-Fourth.

The Commission erred in not holding that in computing the annual reserve for amortization an interest rate of not more than 2% per annum, compounded semi-annually, should be used. (Commission's memorandum opinion No. 49, pp. 21-22.)

The questions raised by the twenty-first, twenty-
2919 second, twenty-third and twenty-fourth assignments
of error were presented to the Commission by applicants in defendants' reply brief, pages 237-247. In holding that in computing the annual reserve to be allowed for amortization of the proper amount to be amortized an interest rate equal to the allowed rate of return should be used, the Commission has proceeded upon a new theory unsupported by authority of law. It has rejected the straight line method of computing the amortization reserve and has adopted an unsanctioned sinking fund method of computing the annual allowance for amortization. It has overlooked entirely the principle underlying the adoption of a sinking fund method of computing the annual allowance for amortization. The underlying reason for employing the sinking fund formula, through the operation of which less than the total amount to be amortized is paid back to the owners by the purchasers, is that an amount is returned each year which can be so managed and invested by the regulated company that at the end of the amortization period the amounts allowed from year to year together with the earnings on those amounts will aggregate the amount to be amortized. The Fifth Amendment to the Constitution requires that the full amount representing the value of applicants' properties be returned to applicants by the end of their operations. To deny them a return of all of the amount operates to confiscate their property, in violation of the due process clause. It is reasonable in computing the annual allowance for this purpose to charge the regulated company with interest on the amounts annually set aside at a rate which the owner of the funds can earn through its investment in outside securities of a character that will
2920 insure, as nearly as is possible, that both the principal and the interest will be available at the close of the owner's business. That underlying principle has been utterly overlooked, or, if not overlooked, ignored, by the Commission in its order at which this application is directed. It has fixed the compound interest rate to be used in computing the amortization reserves at 6½% per annum, the allowed rate of return.

The reason that it is proper to compute the return allowed on the value of applicants' property without depreciating the rate base over the period during which the

new rate will be effective is that, under any sinking fund method of computing the annual allowance for amortization, the full amount to be amortized is not paid by the purchasers; but only a portion thereof is paid. The sum of the annual installments is less than the total amount which must be returned. Applicants must look elsewhere than to their purchasers for a recovery of the difference between the sum of the amounts actually set aside from year to year and the total value of their properties. They cannot be required to put these annual installments to risk in the regulated business or a business of similar risks in order to procure a return to them of the full value of their property. They are entitled to put the reserve in the nearest to risk free investments obtainable. It is impossible to find investments which are risk free, as this record shows without contradiction. It is undisputed in the testimony that 2%, compounded semi-annually, is the highest return which applicants could be expected to earn through the sound investment of the annual allowances for amor-
2921 tization in the highest classes of securities available.

All the errors of which applicants complain are material in their effect upon the rights of applicants, and the effect of each of these errors is confiscation of applicants' property; but the Commission's errors in using the 6½% interest rate, compounded annually, rather than 2%, compounded semi-annually, in computing the allowance for amortization, like its errors in holding that the amortization period should begin in 1932 instead of the present time, are drastic in their results in that the effect of these errors will be to confiscate many millions of dollars of the amount representing the present value of applicants' properties. We shall have more to say on this point in our discussion of the succeeding assignments of error.

Twenty-Fifth.

The Commission erred in holding that as an annual reserve for amortization the sum of only $1,557,852 should be allowed. (Commission's memorandum opinion No. 49, pp. 22 and 26; Commission's order reducing rates, finding No. 12, p. 3, and finding No. 14, p. 4.)

Twenty-Sixth.

The Commission erred in not holding that the proper annual allowance for amortization is at least $5,100,732.

The errors of the Commission pointed out in the twenty-fifth and twenty-sixth assignments grow out of the Commission's errors pointed out in assignments sixteenth to twenty-fourth inclusive. The method by which the amount claimed by applicants as a proper annual allowance 2922 for amortization is calculated is set out in defendants' reply brief, pages 237-247.

We will now undertake to point out specifically the ultimate effect of the errors of the Commission in allowing only $1,557,852 annually as a reserve for amortization.

In the preceding assignments of error, out of which the last two assignments grew, we have pointed out that the proper amount to be amortized is $84,341,218; that the proper period of amortization is that beginning with the effective date of the order, namely, August 1, 1940, and ending with the life of applicants' gas reserves, which, under the uncontradicted evidence, will be exhausted sometime prior to the end of 1954. We have urged that the Commission should apply a safety factor and fix a shorter term for amortizing the value of applicants' property than the remaining life of the field; but, for the purpose of the figures we are about to submit, we will assume that applicants' business will continue through the year 1954, or a period of fourteen years, five months from the effective date of the order. We have pointed out that, if the sinking fund formula be employed in calculating the amortization reserve, the compound interest rate used must be not more than 2%. We have also pointed out that there is no authority for arbitrarily adopting the rate of return as the compound interest rate used in computing the annual allowance for amortization.

Since the proper amount to be amortized is $84,341,218, the holding of the Commission allowing as the amount to be amortized only $78,284,009 results in the confisca- 2923 tion of $6,057,209 of the amount which must be returned to applicants by the end of their project's life. Substantial as is the sum last mentioned, it seems small when compared with the amounts which would be confiscated as a result of the other errors of the Commission in calculating the allowances for amortization.

If $1,557,852 be set aside annually over fourteen years, five months from and after August 1, 1940, the total amount set aside by the end of 1954 will be only $22,459,034. Interest on the several installments, compounded semi-annually at the rate of 2%, will accumulate interest in the amount of $3,282,480. The total allowance, including interest, therefore, will aggregate at the end of the amortization period $25,741,514. Thus it appears that of the $84,341,218 which must be returned to applicants there will be a deficit over the period of $58,599,704, which amount will be absolutely confiscated by the operation of the order. Placing these figures on an annual basis, the amount confiscated each year under the operation of the order is $4,064,710. Even if $78,284,009 were the proper amount to be amortized, as the Commission erroneously found, there would be a total deficit of $52,542,495, or an annual deficit of $3,644,558, which would be confiscated under the operation of the order.

If the proper amortization period were 23 years, as the Commission erroneously found, the setting aside of $1,557,852 annually would accumulate during the 23 year period only $35,830,596. The interest on the annual installments, compounded semi-annually at 2%, would accumulate an additional $9,157,915, or a total accumulation of principal and interest of $44,988,511. Thus it appears that, even if the Commission were right in fixing 23
years as the amortization period, the accumulation
2924 would fall short of the $84,341,218 to which applicants
are entitled over the period by the sum of $39,352,707,
or an annual deficit of $1,710,987, which would be confiscated through the operation of the order. If the Commission were right also in fixing the proper amount to be amortized at $78,284,009, there would still be a deficit of $33,295,498 over the whole period, or an annual deficit of $1,447,630, which would be confiscated under the operation of the order.

Now let us test the order by assuming, contrary to law and the uncontradicted record, that 6½%, the allowed rate of return, should be used as the compound interest rate in computing the annual allowance for amortization. During the fourteen years, five months remaining of the life of applicants' business after the effective date of the order the amount allowed would accumulate $22,459,034. Interest on the annual installments at the rate of 6½% per annum, compounded annually, during the period would accumulate an additional $13,018,702, or a total of $35,-

477,736 as principal and interest. Thus it appears that of the $84,341,218 which must be returned to applicants there will be a deficit over the period of $48,863,482, or an annual deficit of $3,389,367, which would be confiscated under the operation of the order. Applying these figures to $78,284,009, erroneously fixed by the Commission as the amount to be amortized, there would be a deficit of $42,806,263 over the whole period, or an annual deficit of $2,963,381, which would be confiscated.

Even if it be assumed that the Commission did not err in fixing the amount to be amortized, in fixing the
2925 period of amortization, or in fixing the compound interest rate to be used in computing the annual allowance for amortization, the amount allowed is inadequate and results in confiscation in that the sum of the 23 annual allotments of $1,557,852 added to the interest on each annual allotment at 6½%, compounded annually, amounts to only $78,044,638, or $239,361 less than the amount erroneously allowed by the Commission.

Twenty-Seventh.

The Commission erred in eliminating from the allowance for operating expenses the items representing replacements of capital assets subsequent to August 1, 1940, in an amount averaging $188,054 per annum. The estimated cost of these items is included in the $78,284,009 erroneously allowed by the Commission as the proper amount for amortization. However, in estimating applicants' average income available for amortization and return for the period from August 1, 1940, to and including December 31, 1942, the Commission disregarded the estimated cost of replacements during that period. Applicants point out that the Commission failed to include such costs among the operating expenses, thus under its own theory arriving at an amount $188,054 greater than the correct amount available for amortization and return under such theory.

Applicants' position on this question is presented in defendants' reply brief, pages 247-249. The error of the Commission in including the cost of replacements in the erroneous amount allowed for amortization does not offset its error in failing to allow the average cost of replacements as an operating expense. Applicants are entitled to recoup these replacements as operating costs just as they are entitled to an allowance for the cost of items representing maintenance of the pipeline.

2926

Twenty-Eighth.

The Commission erred as a matter of law in finding that 6½% per annum on the rate base allowed is a fair rate of return for applicants, there being no substantial evidence to support the finding. The allowed rate of return purports to cover only the cost of capital, based on the testimony of an employee of the Commission whose conclusion on that point is not supported by his own factual premise. No allowance is made for efficiency and skill in design and engineering, through which applicants are able to operate their facilities under extraordinarily high stresses and to transport gas at extraordinarily high pressures, and efficiency in management in attaining and maintaining an average load factor more than 30% higher than that ordinarily attained by other pipelines, which efficiency and skill account for at least $1,200,000 of applicants' annual revenues, according to the uncontradicted testimony. (Commission's memorandum opinion No. 49, pp. 23-26; Commission's order reducing rates, finding No. 13, p. 3.)

Twenty-Ninth.

The Commission erred in not finding that the fair rate of return for applicants is not less than 8%.

The subject of a proper rate of return consumes a very substantial portion of the entire record, including numerous exhibits dealing with the cost of capital and other statistical subjects. In their reply brief, pages 278-391, applicants devoted more than 100 pages to a discussion of the evidence and the authorities going to this subject. We adopt and again urge all that we presented in the brief on this question. It is not practical, of course, for us to undertake here to go into an analysis of the testimony. Suffice it to say we still insist that there was no factual support in his own figures for the conclusions stated by the witness Smith that earnings of 6.2% to 6.5% would enable applicants to refinance even on the basis of 40% bonds, 20%
preferred stock, and 40% common stock. The very
2927 figures set out on page 24 of the Commission's memo-
randum opinion show a cost of refinancing in excess
of 6.5%. The Commission says, "The cost of money to such company would be 3.75 per cent for the bonds, 6.10

per cent for the preferred, and 10 per cent cost of floating the common stock." Had the Commission analyzed these figures it would have found that the total overall cost would amount to 6.72%, or 22/100 of 1% in excess of the earnings allowed. As demonstrated by Exhibit 209 and pointed out specifically in defendants' reply brief, pages 299-303, the exhibits submitted by the witness Smith, when supplemented by essential facts not shown in such exhibits, show that the cost of capital to natural gas pipeline companies would amount, on Smith's division of 40% to bonds, 20% to preferred stock, and 40% to common stock, to 7.71%; but all witnesses agreed that practically no preferred stock has been floated during the past several years by natural gas pipeline companies, for very good reasons reflected by the uncontradicted testimony. If the bonded indebtedness be increased to 50% and the common stock represent the other 50%, the same figures show that the overall cost would be in excess of 8%.

It is true that Smith testified that applicants could finance on as favorable a basis, if not a more favorable basis, than any natural gas producing and transmission company in the United States; but that conclusion by the witness is not sustained by the factual evidence brought in by the same witness through his exhibits. He admits that he knows substantially nothing about the particular risks confronting applicants, or, for that matter, the risks confronting the other pipeline companies with which he deals in his exhibits. His statement on that
2928 point is entitled to no more dignity than that of a mere guess.

As to the witness Kleinman, who is the only witness who testified that less than 8% would be a reasonable and proper rate of return, we have demonstrated in defendants' reply brief, pages 306-316, that the witness is utterly unqualified from a standpoint of experience, if not disqualified by reason of bias and prejudice. He admitted that his conclusion that 6% is a proper rate of return for applicants was based on his judgment that applicants were entitled to a lower rate of return than electric and gas distributing companies, on the theory that applicants are confronted with fewer risks than such distributing companies. He had already admitted that the Illinois Commerce Commission had recently allowed an electric utility a return of 6.3%. The abandon with which the witness approached his final conclusion, as pointed out on pages 313-314 of defendants' reply brief, should prompt the Commission utterly to disregard his testimony.

The Commission observes that there is abundant evidence disclosing that we are today at a point where rates of return demanded are among the lowest that have ever existed. We challenge that statement. The testimony is that the interest rates for short term loans of the very highest order and the yields on bonds of the very highest order are lower than at any time during the period covered by the exhibits. The evidence does not show that rates of return demanded are the lowest which ever existed. The testimony is exclusively to the effect that capital is staying out of industry and enterprise to an alarming degree, due to the circumstance that its owners are not willing to invest it at the prevailing rates obtainable. 2929

The Commission says that the exhibits put into evidence by practically every witness show that today overall returns are lower than before. Let that be granted; but these exhibits uniformly show that there is a wider margin between the yields on high grade bonds and the compensation demanded for risk than has ever obtained during the period covered by the exhibits. There is no showing that the overall returns and yields in the natural gas business over the past several years and at the time the exhibits were prepared were as low as 8%, not to speak of 6½%, the rate allowed by the Commission.

The Commission makes no pretense of allowing anything but cost of financing in the rate of return fixed, and, as already pointed out, it failed to allow the overall cost of refinancing as reflected by its own figures. No allowance whatever is made in the rate fixed for the circumstance that by reason of their enterprise, their engineering skill in designing and constructing the facilities employed, and the unusually efficient management of applicants in operating the line and marketing their products, applicants operate their facilities at the highest stresses and pressures ever attained by any pipeline company, with the result that they are able to transport, and do transport and market through their facilities, substantially higher volumes of gas than the quantities normally transported through pipelines of the same diameter by other companies. No allowance is made for the circumstance that by the exercise of extreme and sustained diligence, applicants have been able to build up and maintain an annual load factor of 92% of the maximum pipeline capacity, as compared with 70% ordinarily attained by other pipeline companies. No allowance is made for the circumstance that this skill, efficiency, diligence and man- 2930 agement account for at least $1,200,000 annually of applicants' revenues.

It is inconceivable that the Commission would consciously attempt to cut the allowed return down to the point where it could barely escape the test of confiscation. The rate allowed does not meet that test; for it does not cover the actual cost of refinancing, much less any additional compensation for other elements which must be allowed applicants if the rate of return is to be fair and reasonable. In the light of the record, a finding that a rate of return of 6½% per annum is fair and reasonable presents a question of law, for there is no substantial evidence to support it. Only if the rate allowed were 8% or in excess of 8% could the finding of the Commission be upheld under the rule that its findings on the facts are conclusive. There is a difference of opinion among the witnesses qualified to testify on this point as to whether the rate of return should be 8% or some higher rate; but there is no evidence of probative force that would justify fixing the rate of return at less than 8%.

Thirtieth.

The Commission erred in holding that the annual amount necessary for a fair return to applicants is not more than $4,837,328 and that the proper allowance for amortization is $1,557,852, or a total of $6,395,180 for fair return and amortization. (Commission's memorandum opinion No. 49, p. 26; Commission's order reducing rates, finding No. 14, p. 4.)

Thirty-First.

The Commission erred in finding that applicants' 2931 annual net revenues available for amortization and return exceed the amount reasonably necessary by $2,966,852. (Commission's memorandum opinion No. 49, p. 26; Commission's order reducing rates, finding No. 16, p. 4.)

Thirty-Second.

The Commission erred in ordering that the rates and charges made, demanded or received by applicants in connection with their transportation and sale of natural gas shall be reduced to reflect a reduction of not less than $3,750,000 per annum in the operating revenues of Natural Gas Pipeline Company of America. (Commission's memorandum opinion No. 49, p. 26; Commission's order reducing rates, paragraph (A), p. 4.)

Thirty-Third.

The Commission erred in finding that the rates and charges after reflecting the reductions ordered will be just and reasonable. (Commission's order reducing rates, finding No. 19, p. 4.)

The errors pointed out in the last four assignments naturally follow the errors pointed out in the preceding assignments, and the same observations presented above in connection with the preceding assignments and in the briefs and oral arguments are applicable to and are here adopted and urged in support of the last four assignments.

Thirty-Fourth.

The Commission erred in ordering that applicants file new schedules of rates and charges to reflect a reduction of not less than $3,750,000 per annum in the operating revenues of Natural Gas Pipeline Company of America effective as to all bills regularly rendered on or after September 1, 1940. (Commission's order reducing rates, paragraph (B), p. 4; Commission's order dated August 8, 1940, paragraph (A).)

Thirty-Fifth.

The Commission erred in ordering that from and after
the effective date of the new schedules ordered to be filed
applicants shall cease and desist from making, de-
2932 manding or receiving any rates and charges which
do not reflect the reduction ordered in Paragraph
(A) of the Commission's order reducing rates. (Commis-
sion's order reducing rates, Paragraph (D), p. 5.)

Thirty-Sixth.

The Commission erred in denying applicants' application for a stay of the Commission's order dated July 23, 1940, pending the filing of an application for rehearing and the disposition of such application, and, in the event such application be denied, pending the review of said order by the courts on appeal. (Defendants-respondents' motion for stay filed August 8, 1940; Commission's order denying in part the motion for stay, dated August 8, 1940, Paragraph (B).)

The result of the Commission's order directing that the new rates prescribed in the order be effective immediately is an unconstitutional application of the Natural Gas Act. Under the express terms of the Natural Gas Act, applicants are not permitted to file a petition for judicial review of the Commission's order until after action upon an application to the Commission for a rehearing, or the lapse of thirty days after the filing of such application. Applicants are denied a free and untrammeled court review of said order, as guaranteed by the Constitution of the United States, and are put to the choice of submitting to said order and giving up substantial sums of money each month which they can never recoup, or defying the order and thus subjecting themselves to the risk of being prosecuted under the severe penal provisions of the Natural Gas Act, without opportunity for judicial review of the order during the period pending the filing of the application for rehearing and the disposition thereof by the Commission.

2933 Wherefore, applicants pray that they be granted a rehearing herein and that the Commission enter an order abrogating and setting aside its order reducing rates dated July 23, 1940.

ORDER DENYING APPLICATION FOR REHEARING.

Upon consideration of the application of Natural Gas Pipeline Company of America and Texoma Natural Gas Company filed August 19, 1940, for rehearing with respect to the Commission's Order Reducing Rates of Natural Gas Pipeline Company of America entered on July 23, 1940, and the Commission's Opinion No. 49;

The Commission finds that:

No new facts have been presented or alleged in the application for rehearing which would justify a reversal or revision of the Commission's said Order and said Opinion

No. 49, entered July 23, 1940, and no principles of law are stated in the application for rehearing which were not fully considered by the Commission before it rendered said Order and said Opinion;

Now, therefore, the Commission orders that:

The application for rehearing be and it is hereby denied.

By the Commission.

Leon M. Fuquay,
Secretary.

2936 IN THE UNITED STATES CIRCUIT COURT OF APPEALS

For the Seventh Circuit.

October Term, 1940.

Natural Gas Pipeline Company of America and Texoma Natural Gas Company, *Petitioners,* *vs.* Federal Power Commission and Illinois Commerce Commission, *Respondents.*	No. 7454.

I, Leon M. Fuquay, Secretary of the Federal Power Commission and official custodian of the records of said Commission, do hereby certify that the attached are true copies of:

1. Complaint of Illinois Commerce Commission filed in Docket No. G-109 on September 23, 1938;
2. Order instituting investigation entered October 14, 1938, in Docket No. G-112;
3. Answer of Defendants' filed on November 16, 1938, in Docket No. G-109;
4. Order fixing date of hearing for May 8, 1939, and consolidating Docket Nos. G-109 and G-112 for purposes of hearing entered April 14, 1939;
5. Designation of Examiner Frank M. Durrance to preside at hearing set for May 8, 1939, filed April 18, 1939;
6. Transcript of hearings held May 8 and 9, 1939;
7. Designation of Examiner Ewing G. Simpson to preside at hearing to be resumed May 22, 1939, filed May 17, 1939;

2937 8. Transcript of hearings held May 22, 23, 24, 25,
26, 29, 30, 31; June 1, 2, 26, 27, 28, 29, 30; July 24, 25,
26, 27, 28, 29, 31; August 1, 2, 3 and 4, 1939;

9. Notice postponing hearing to August 28, 1939 filed August 16, 1939;

10. Transcript of hearings held August 28, 29, 30, 31; September 1, 5, 6, 7, 8; October 2, 3, 4, 5, 6, 23, 24, 25, 26, 27, 28, 30, 31; November 1, 2, 3, 4, 6 and 7, 1939;

2940 IN THE UNITED STATES CIRCUIT COURT OF APPEALS

Filed Sept. 11, 1940.

For the Seventh Circuit.

October Term, 1940.

Natural Gas Pipeline Company of America and Texoma Natural Gas Company,
Petitioners,
vs.
Federal Power Commission and Illinois Commerce Commission,
Respondents.

No. 7454

PETITION FOR REVIEW OF INTERIM RATE ORDER OF FEDERAL POWER COMMISSION.

To Said Honorable Court:

Natural Gas Pipeline Company of America, a corporation, and Texoma Natural Gas Company, a corporation, hereinafter called petitioners, respectfully show:

I.

Each of petitioners is a private corporation organized and existing under and by virtue of the laws of the State of Delaware, and each is located and has its principal place of business at 20 North Wacker Drive, in the City of Chicago, State of Illinois, within the Seventh Circuit.

II.

Respondent Federal Power Commission is a Government commission created by an act of Congress, having its principal office and place of business in the City of Washington, District of Columbia.

Respondent Illinois Commerce Commission is a state
commission created by an act of the Legislature of Illinois,
having its principal office and place of business at
2941 Springfield, Illinois, and also an office in Chicago,
Illinois, both Springfield and Chicago being within the
Seventh Circuit.

III.

Petitioners seek a review of a so-called interim order directing petitioners to file a new schedule of rates and charges to effect a reduction in their operating revenues in the amount of $3,750,000 a year, entered and issued by respondent Federal Power Commission on July 23, 1940, and amended by supplemental order dated August 8, 1940, under purported authority of the Natural Gas Act (15 U. S. C., Chapter 15B). The jurisdiction of this Court is invoked under Section 19(b) of the Natural Gas Act (15 U.S.C. 717r(b)).

IV.

Since about January 1, 1932, petitioners have been, and they are at this time, engaged in the business of producing and purchasing natural gas and in transporting and selling at wholesale such natural gas in interstate commerce. Petitioner Texoma Natural Gas Company owns large reserves of gas in what is commonly known as the Panhandle gas field, in the State of Texas, which reserves underlie a great number of gas leases acquired, consolidated, developed and held by said petitioner. On its leases said petitioner has drilled many wells, from which it produces natural gas into a pipeline gathering system by it constructed, owned and operated, through which it transports such gas to its compressor station near the town of Fritch, in the State of Texas, and thence through its main pipe-

The interim order,[2] complained of, was entered by the Commission, July 23, 1940, accompanied by a detailed memorandum showing the basis for the order. There were also specific findings. It was made upon a motion by respondent, Illinois Commerce Commission, for an "immediate order." This motion was followed by petitioners' plea to the jurisdiction and an answer. The motion for the interim order was made before termination of a complete investigation, but after fifty-five days of hearing. The order was entered six months later.

---

domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale * * *.

SECTION 4. (a) All rates and charges * * * shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

SECTION 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State * * * commission, * * * shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural gas company * * * or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification * * * or contract to be thereafter observed and in force, and shall fix the same by order: Provided, however, That * * * the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

[2] The Commission * * * finds that:

"(1) The * * * Pipeline Co. * * * is engaged in the transportation of natural gas in interstate commerce by means of its 24-inch natural gas main transmission pipe line, approximating 900 miles in length, extending from * * * Okla. * * * through Kansas, Nebr., and Iowa, and into * * * Ill. * * * near Joliet; is also engaged in the sale in interstate commerce of natural gas so transported to various purchasers for resale for ultimate public consumption for domestic, commercial, industrial * * * uses; and is a 'natural gas company' within the meaning of the Natural Gas Act;

"(2) * * * approximately 90% of the natural gas transported and sold by * * * Pipeline Co. * * * is sold to the Chicago Dist. Pipeline Co., for resale for public consumption, delivery being made near Joliet, * * *.

"(3) The Texoma * * * Co. * * * is engaged in the production * * * of natural gas in the Texas Panhandle field; * * * in the transportation of natural gas * * * by means of its 24-inch * * * pipe line, * * * 75 miles in length * * * from its compressor station in * * * Texas * * * into * * * Okla. * * * to its sales meter and connection, near Gray's Junction, with the system of the * * Pipeline Co. * * *; is also engaged in the sale * * * of gas * * * for resale for ultimate public consumption for domestic, commercial, industrial, * * * and is a 'natural-gas company' within * * * the Act;

"(4) * * * approximately 90% of the natural gas so produced * * * by the Texoma Co. * * * is * * * sold by it to the Pipeline Co. * * * at the aforesaid delivery point (in) * * * Okla.;

"(5) The Ill. Com. Com. is a 'State commission' within the * * * Act;

"(6) The rates * * * charged, * * * by Pipeline Co. * * * for * * * the sales of natural gas * * * are subject to the jurisdiction of this Commission;

"(7) The * * * defendants * * * are * * * operated as a single enterprise * * *;

"(8) Until further order of this Commission and for the purpose of disposing of the motion before us, a rate base composed of the Companies' estimates may be accepted, as follows:

"Reproduction Cost New of Physical Properties (exclusive of gas reserves) as of June 1, 1939	$56, 302, 250
"Value of Gas Reserves as of June 1, 1939	13, 334, 775
"Capital Additions from June 1, 1939, to December 31, 1942	3, 808, 399
"Working Capital	975, 000
Rate Base	74, 420, 424

"(9) The total capital expenditures of the Companies through December 31, 1954, less salvage (including all capital expenditures to date), based upon the Companies' estimates, will be not more than $78,284,009, which is the amount on which provision for amortization should be calculated;

"(10) The period over which the provision for amortization should be calculated is the entire life of the properties, estimated by the Companies to be 23 years, 1932–1954, inclusive;

"(11) * * * amortization should be calculated on a sinking fund basis, with interest * * * at the rate of 6½% per year, compounded annually;

Briefly stated, the Commission ordered the $3,750,000 reduction in revenues on the following fact that assumptions:

Investment for rate base purposes (this was made up of reproduction cost, value of gas reserves, capital additions, and working capital)	$74,420,424
A return of 6½% was allowed	6½
	4,837,328
Annual amortization was added. (The amount allowed for amortization covered a period of 23 years, from 1932 to 1954)	1,557,852
Total deductions	6,395,180
The adjusted average annual net income was	9,362,032
The above determined required amount was	6,395,180
Excess	2,966,852

The lessening of petitioners' income by this amount would result in an income tax saving. Hence the total reduction ordered was increased from $2,966,852 to $3,750,000.

A many sided attack on the order is made by the petitioners.

First, they challenge the Commission's jurisdiction to enter this order because:

(a) The only authority given by the Act is to enter a final order.

"(12) The required annual allowance for amortization is $1,557,852;

"(13) The fair rate of return for the Companies is not more than 6½% per annum;

"(14) The annual amount necessary for a fair return to the Companies is not more than $4,837,328, which, with * * * $1,557,852 for amortization * * * amounts to a total of $6,395,180, for amortization and a fair return.

"(15) The Companies' annual net revenues * * * based upon the Companies' estimates, averaged for 1939 to 1942, inclusive, will be $9,511,454, which will be reduced to approximately $9,362,032 as a result of the calculated increase in Federal taxes under the 1940 Revenue Act;

"(16) The Companies' annual net revenues * * * exceed the amount reasonably necessary * * * by $2,966,852;

"(17) A reduction in annual net revenues of $2,966,852, together with the consequent reduction in the applicable Federal Income Tax, would permit a reduction in rates (gross operative revenues) of $3,750,000;

"(18) The rates and charges made * * * by defendants * * * are unjust, unreasonable, and excessive;

"(19) The rates and charges of defendants * * * after reflecting the reductions hereinafter ordered, will be just and reasonable:

"Therefore, the Commission orders that:

"(A) The rates and charges made * * * by defendants * * * shall be reduced to reflect a reduction of not less than $3,750,000 per annum in the operating revenues of * * * Pipeline Co. * * *

"(B) Defendants * * * shall file on or before August 15, 1940, new schedules of rates and charges * * * which shall reflect the reduction in operating revenues ordered in paragraph (A) above, which new schedules * * * shall be effective as to all bills regularly rendered on or after September 1, 1940;

"(C) The Commission reserves the right to reject all or any part of such new schedules and in lieu thereof to prescribe the same by further order;

* * * * *

"(E) The record herein shall remain open for such further proceedings as the Commission may deem necessary or desirable;

"(F) The motion by defendants * * * to dismiss the motion for immediate interim order reducing rates for want of jurisdiction * * * is denied;

"(G) The motion by defendants * * * to dismiss the motion for immediate interim order * * * for want of sufficient evidence of record be and the same is denied;

"(H) This order shall not be construed as an acquiescence by this Commission in any estimates or determinations of original cost, or any valuation of property, claimed or asserted by said defendants * * *."

(b) There is only authority to enter orders determining rates (Sec. 5) whereas here the order directed reduction of income and left the company to determine the rates, which burden is doubled because they have contracts with varying rates, and they are not instructed how to apportion the reduction.

(c) The constitutionality of the Act is attacked because the companies' business is a private business and this Act, contrary to the Fifth Amendment, makes it subject to regulation as a public utility, and they have not even an opportunity to withdraw from business.

(d) The companies are not the kind of companies meant to be covered by the Act.

(e) There has been a denial of due process because there has been no full hearing.

(f) Since the companies' existing rates are presumably reasonable, the Commission has the burden of showing the contrary, and it has not sustained its burden. It has merely provided for a return, barely nonconfiscatory, rather than reasonable, and ignored the fact that the profits arose from the operator's engineering skill and the fact that the profits accruing are but a reasonable reward for the risk involved.

(g) The Illinois Commerce Commission has no legislative authority to move for such an order, and the Federal Power Commission in moving for such order is acting as prosecutor and court.

Second, they challenge the interim order of the Commission on its accounting theories:

(a) The "base" taken by the Commission is wrong because it excluded the item of going concern value of $8,500,000; it permitted only $3,808,399, instead of $6,046,286, for future capital expenditures, and it refused to exclude from the base, $2,866,758, for "viewed" depreciation. So, the base taken by the Commission ($74,420,424) was $7,771,129 less than the base contended for by the companies—i. e., $82,291,553.

(b) The 6½% return used by the Commission was unreasonably insufficient, and unsupported by the evidence. Not less than an 8% return should have been allowed.

(c) The period taken for amortization was wrong, namely, it should have started from the effective date of the Act, and not from the beginning of the companies' business.

(d) The base used for amortization, i. e., $78,284,009, was too low; it should have been $84,341,218.

(e) The amortization reserve should have been figured on a straight line basis with the interest at the rate of 2% semiannually, instead of on the sinking fund basis with interest at 6½%, compounded annually. The annual amortization allowance should have been $5,100,732, instead of $1,557,852.

I. Constitutionality of Act as applied to petitioners. The argument supporting this view runs like this: (a) Petitioners are not in fact, or law,[3] a public utility, and the legislative declaration that they are, is unconstitutional[4] and ineffective to make them such. They do not sell to the public. 98% of their product is sold to wholesale customers. The price they charge has small effect on the consumer's cost because the service company's fixed charges are the dominant factor in ultimate cost to the public. Their gas is but an element in the product the public purchases, which also contains artificial gas. The fact that gas is widely used by the public is not important, for, they argue, so are meat, groceries, and many other unregulated commodities.[5] (b) The Act changes an existing, wholly private industry into a public utility, burdened with many iron-bound mandates—all this without giving petitioners a right to withdraw from the harshness of such supervision, and is therefore a violation of the Fifth Amendment.[6] They cite the fact that the Act delegates to the Power Commission the power to choose their customers for them (Sec. 7) and prohibits their dropping a customer—unsatisfactory though he may be.

We conclude, without much doubt, that the Natural Gas Act is constitutional. It falls within the Commerce Clause of the Federal Constitution. The necessity for its enactment was legislatively declared in Sec. 1 (a) (above quoted), and "it may not be annulled unless palpably in excess of legislative power.[7] Condemnation on this last-named ground lacks factual support in the instant case.

We appreciate, and may concede, the force of petitioners' factual distinction of the Nebbia, the Sunshine, and Appalachian Cases. They all involved, it is true, critical, economic conditions which demanded legislative solution, and such critical condition and urgent necessity of immediate control are here absent. But, where a legislative determination is based upon a very extended administrative investigation, which concluded that an industry was

[7] Nebbia v. N. Y., 291 U. S. 502; Sunshine Coal Co. v. Adkins, 310 U. S. 381; U. S. v. Appalachian Electric Pow. Co., decided Dec. 16, 1940.

Nebbia v. N. Y.:

"Thus has this court from the early days affirmed that the power to promote the general welfare is inherent in Government. * * * These correlative rights, that of the citizen to exercise exclusive dominion over property and freely to contract about his affairs, and that of the state to regulate the use of property and the conduct of business, are always in collision. * * * But subject only to constitutional restraint the private right must yield to the public need. * * * The Fifth affected with a public interest and that Federal regulation thereof was necessary and that said business or industry is producing and transporting natural gas to be sold to gas companies engaged in public utility businesses in cities and villages, there exists no basis for a successful attack on such determination.

The natural gas industry controls the source of a commodity of great public importance and widespread consumption, and therefore its regulation by Congress may well be required. At least, Congress, in its wisdom, may so conclude. Courts cannot, and should not, assume a greater wisdom than Congress, and find otherwise. The court's function, at most, would be limited to an inquiry as to the existence of facts which would support legislative determination.

II. Form of Order, i. e., ordering a reduction of income of a designated amount, and not determining precise rates to be charged. Petitioners challenge, and respondents do not discuss the challenge, that the Commission's authority is only to "determine the just and reasonable rate * * * and shall fix the same by order." (Sec. 5; Title 15 U. S. C. A. Sec. 717d.)

The order of the Commission found the existing rates unreasonable and excessive, and ordered that they be reduced to reflect a decrease of $3,750,000 in operating revenues. This order did not "determine" the rates. But it evidenced the conclusion that the existing rates were too high and should be lowered such an amount as would reflect a specific reduction in profits.

Amendment, in the field of federal activity, * * * do not prohibit governmental regulation for the public welfare. They merely condition the exertion of the admitted power, by securing that the end shall be accomplished by methods consistent with due process.

"The Constitution does not guarantee the unrestricted privilege to engage in a business or to conduct it as one pleases. Certain kinds of business may be prohibited; and the right to conduct a business, or to pursue a calling, may be conditioned. Regulations of a business to prevent waste of the state's resources may be justified. And statutes prescribing the terms upon which those conducting certain businesses may contract, or imposing terms if they do enter into agreements, are within the state's competency.

"We may as well say at once that the dairy industry is not, in the accepted sense of the phrase, a public utility. We think the appellant is also right in asserting that there is in this case no suggestion of any monopoly or monopolistic practice. It goes without saying that those engaged in the business are in no way dependent upon public grants or franchises for the privilege of conducting their activities. But if, as must be conceded, the industry is subject to regulation in the public interest, what constitutional principle bars the state from correcting maladjustments by legislation touching prices? We think there is no such principle. * * * This court concluded (In Munn v. Illinois, 94 U. S. 113) the circumstances justified the legislation as an exercise of the governmental right to control the business in the public interest; that is, as an exercise of the police power. * * * 'Property does become clothed with a public interest when used in a manner to make it of public consequence, and affect the community at large' * * *. Thus understood, 'affected with a public interest' is the equivalent of 'subject to the exercise of the police power'; * * * The statement that one has dedicated his property to a public use is, therefore, merely another way of saying that if one embarks in a business which public interest demands shall be regulated, he must know regulation will ensue. * * *

"Many other decisions show that the private character of a business does not necessarily remove it from the realm of regulation of charges or prices * * *. * * * Private contract carriers who do not operate under a franchise, and have no monopoly of the carriage of the goods or passengers, may, since they use the highways to compete with railroads, be compelled to charge rates not lower than those of public carriers * * *.

"It is clear that there is no closed class or category of businesses affected with a public interest, and the function of courts in the application of the Fifth and Four-

The resulting rate might vary, depending upon which class of purchasers should be favored. It failed to name the customer (the utility, the commercial, or the industrial purchasers) and the degree of reduction to be allocated inter se. The Commission determined the underlying factors determinative of a rate sufficient to produce a fair and reasonable profit. The order left the companies free to apportion the reduction among the customers.

This action, while irregular and unusual, we believe, in rate determining commissions, was in no way harmful or prejudicial to the companies. In fact, it was favorable to them. It lodges a discretion—or play—in them whereby they might adjust the rates in the various classifications as may to them seem meet. Doubtless they will have some difficulty convincing their customers of the fairness of the reduction. But the difficulty is present, whether the regulating commission or the utility makes the adjustment. The fact that the rate is lessened, rather than increased, should not be overlooked.

We are convinced, and so hold, that petitioners to successfully attack an order of the Commission, must show they are aggrieved by the part of the order assailed. We find no prejudice to petitioners in the form which the order took.

---

teenth Amendments is to determine in each case whether circumstances vindicate the challenged regulation as a reasonable exertion of governmental authority or condemn it as arbitrary or discriminatory.

"So far as the requirement of due process is concerned, and in the absence of other constitutional restriction, a state is free to adopt whatever economic policy may reasonably be deemed to promote public welfare, and to enforce that policy by legislation adapted to its purpose. The courts are without authority either to declare such policy, or, when it is declared by the legislature; to override it. If the laws passed are seen to have a reasonable relation to a proper legislative purpose, and are neither arbitrary nor discriminatory, the requirements of due process are satisfied, and judicial determination to that effect renders a court functus officio.

"Times without number we have said that the legislature is primarily the judge of the necessity of such an enactment, that every possible presumption is in favor of its validity, and that though the court may hold views inconsistent with the wisdom of the law, it may not be annulled unless palpably in excess of legislative power."

Sunshine Coal Co. v., Adkins, 310 U. S. 391:

"Nor does the Act violate the Fifth Amendment. Price control is one of the means available to the state * * * and to the Congress in their respective domains * * * for the protection and promotion of the public welfare of the economy. But appellant claims that this Act is not an appropriate exercise of the Congressional power. It urges that the nature and use of bituminous coal in no wise endangers the health and morals of the populace; that no question of conservation is involved; that the ills of the industry are attributable to overproduction * * *. Those matters, however, relate to questions of policy, to the wisdom of the legislation, and to the appropriateness of the remedy chosen—matters which are not our concern. If we endeavored to appraise them we would be trespassing on the legislative domain. And if we undertook to narrow the scope of federal intervention in this field, as suggested by appellant, we would be blind to at least thirty years of history. * * *

"It was the judgment of Congress that price-fixing and the elimination of unfair competitive practices were appropriate methods for prevention of the financial ruin. * * * in this industry. * * * To invalidate this Act we would have to deny the existence of power on the part of Congress under the commerce clause to deal directly and specifically with those forces which in its judgment should not be permitted to dislocate an important segment of our economy and to disrupt and burden interstate channels of trade. * * * The commerce clause empowers it to undertake stabilization of an interstate industry through a process of price-fixing which safeguards the public interest by placing price control in the hands of its administrative representative."

U. S. v. Appalachian Elec. Power Company, decided Dec. 16, 1940.

"In truth the authority of the United States is the regulation of commerce on its waters. * * * That authority is as broad as the needs of commerce. * * * The Congressional authority under the commerce clause is complete unless limited by the Fifth Amendment."

III. Existence of Substantial Evidence to support Commission's finding that present rates are unreasonable.

This query bring us to the merits of this appeal—to the heart of the controversy.

The statute (Sec. 19; Title 15, U. S. C. A., Sec. 717 r) provides:

"The finding of the Commission as to facts, if supported by substantial evidence, shall be conclusive."

It also provides that,

"No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing, unless there is reasonable ground for failure so to do."

Petitioners contend that the record is absolutely wanting in any evidence that their existing charges are unreasonable, "unless it be the circumstance that their earnings exceed a 6½% rate of return * * *," and they further contend that returns must be 'enormously disproportionate' before they are even 'some' evidence that the charge yielding the return may be excessive."

They present an amazingly interesting picture of the difficulties of long distance transportation of natural gas, of the tremendous effort, skill, and risk taken by these companies, of the extraordinary improvements necessary in pipe construction and other apparatus, of economic management of business—securing fill-in contracts in slack periods, and maintaining high loads in pipe lines, without which petitioners' business would be on the rocks (or invoking Sec. 77B of the Bankruptcy Act) instead of perplexing commissions and courts with questions arising out of large profits.

They most urgently point out that a profit which exceeds a barely non-confiscatory return is not ipso facto an unreasonable or illegal return.[8] Therefore, the Commission's reduction of profit based solely on a finding of unreasonableness because the profit exceeded said barely non-confiscatory return is without evidentiary support, and the Commission's order must fall.

The Commission answers this argument by pointing out the precedents announced in the Labor Act Cases, specifically the Link Belt Labor Case, decided January 6, 1941, and other Federal Acts involving review of action taken by administrative boards, by courts, and say, if there be any evidence to support the finding, it must stand. In fact, it is then removed from the field of judicial inquiry and review.

---

[8] Banton v. Belt Line Corp., 268 U. S. 413.

"A commission or other legislative body, in its discretion, may determine to be reasonable and just a rate that is substantially higher than one merely sufficient to justify a finding in a confiscation case that it is high enough to yield a just and reasonable return on the value of the property used to perform the service covered by the rate. The mere fact that a rate is nonconfiscatory does not indicate that it must be deemed to be just and reasonable. It is well known that rates substantially higher than the line between validity and unconstitutionality properly may be deemed to be just and reasonable, and not excessive or extortionate."

The Commission also points out that the companies nowhere raised the point of lack of substantial evidence, and so are now (by virtue of the statutory provision in review, above quoted) precluded from so objecting. A complete answer to the contention that the companies failed to object to the substantiality of the evidence to support the finding is to be found in petitioners' assignment of error in their petition for rehearing—

"The Commission erred in finding that the rates and charges presently charged by petitioners are unjust, unreasonable, unlawful and violative of the provisions of the Natural Gas Act."

While the assignment is broad, it is supplemented by others which make it clear, what must have been obvious throughout the many days when testimony was being taken, that petitioners were denying, as a matter of fact, the unreasonableness of the rates in force. Other assignments of error, in the petition for rehearing before the Commission, complained of related points, to-wit:

"The Commission erred in not holding that the proper rate base is the present value of the property, which, under the uncontradicted evidence, is made up of * * *."

Also,

"The Commission erred in holding that the sum of $8,500,000 claimed by applicants as going concern value is an arbitrary claim not supported by substantial evidence.

"It is supported by substantial evidence which is uncontradicted."

Petitioners attack the order because "The Commission is without power and jurisdiction to enter an interim order."

The fatal weakness of this contention lies in counsel's failure to choose a true perspective—make a proper approach to the policy of governmental regulation (as evidenced by this legislation), of the natural gas industry, which includes its production, transportation, and distribution. Like other legislation of this character, it should be liberally construed and interpreted, so as to embrace, within its scope, the implied powers necessary to an exercise of the expressly granted powers. In petitioners' argument, there is a tendency, which is somewhat characteristic of arguments in cases which attack powers of Congress and the procedure of the regulating commission, to observe, "I do not find it written in the bond."

There can be no question that the Act confers upon the Commission the power to make a final order. Had the Commission closed its hearing and then made the order in question, it would have come within its expressly delegated powers.

We take it that this argument goes so far as to deny to the Commission, authority to do anything else; that it could not make an interim order even upon consent of the parties. In other words, if we accept this contention, a hearing might proceed to a point where all the petitioners' testimony was received, and they had rested their case; upon which showing it was conceded an order reducing charges should be made; that the utility's consent thereto was formally given—even then the Commission would be powerless to make an order, because perchance it wished to inquire further into certain practices and charges which affected rates only indirectly, which matters the petitioners were particularly anxious to have settled. Such a holding would do violence to the purpose and object of the legislation.

While the practice and construction of powers of a court of equity are not necessarily controlling, they supply a lamp to guide courts in determining the extent to which they may imply powers from the grant of express powers. Not seriously would it be argued that a court of equity given jurisdiction of a subject and granted the express power to make a final order to fix rates was powerless, on a proper showing, to make an interim order limiting profits.

We must, and do, hold that upon a proper showing, and when the hearing has reached a stage where the Commission may determine that a reduction (or an increase) of rates should be made, it may (and should) make such order, even though the hearing be not completed.

Rate of Return.—Petitioners advance three propositions in respect to the findings and the deductions from said findings of the Commission upon the rate of return. The Commission found a return of 6½% was fair and reasonable. Petitioners say: (a) Their earnings, which exceeded this rate, do not evidence unreasonableness; (b) reasonableness of rates is determined "not by what profit it is reasonable to make, but what it is reasonable to charge for the services rendered;" (c) the rate of return fixed by the Commission at 6½% was, in view of the facts of this case, grossly inadequate.

We reject, without extended discussion, the contentions (a) and (b). They ignore the well-established holdings, backed by reason and experience, to the effect that a fair rate of return, on a fairly established rate base, supplies the correct test of reasonableness.[9] The value of the service to users is neither a reasonable rule, nor supported by judicial decisions.

This seems too elementary to require elaboration or supporting argument. Likewise, it must be apparent, on this theory of correct rate making, that the rate of return not only may, but, in a utility rate case, must be, the largely determinative factor of reasonableness.

---

[9] Los Angeles Gas Corp. v. Rd. Com., 289 U. S. 287.

(c) The reasonableness of a 6½% rate of return presents a question altogether different from (a) and (b). It is perplexing and incapable of determination with certainty, in view of the peculiar facts of this case. Out of the mass of decisions pertaining thereto, a rule may be stated with comparative ease, but its application is quite as difficult as the statement is easy.

A fair return is to be largely measured by the usual returns in like investments in the same vicinity over the same period of time.

What are like investments? What are the years we must use to ascertain the going rate of return for said like investment? Relativity seems to be highly present both in the term "like investment" and in the years for which fair earnings must be ascertained.

Ignoring, for the moment, the kind of investment involved, and looking only to rate of return, as such, on investments only, we take judicial notice of the fact that interest rates in most fields have declined in the last decade as much as 75%. For example, call money rates in New York dropped from 8% in 1929 to ⅛–¼ of 1%. Interest rates on Class AAA bonds have dropped enormously. Secure, but less highly rated, bonds have shown a like lowering of interest return.

What years should be chosen to determine the fair rate of yield? More uncertain still, what will the thirteen future years bring forth? Will the rise in rate of return be as great and as rapid as has been the decline during the last decade?

But, if there be doubt and uncertainty as to the correct dates and rates, past and future, for interest charge determination on safe investments, they are inconsequential as compared to the variance in returns on well secured, as compared to returns on highly speculative investments.

The demanded rate of return, since the crash of '29 and the bank failure period immediately following it, has been almost fatal to speculative investments. The investing public has emphasized safety, and shied from the speculative. That the investment in petitioners' enterprise in '32 was highly speculative, can not be successfully gainsaid. A "fair rate of return," on this highly speculative investment, should not be affected by the extraordinary success which has marked its record for the latter part of its existence. The ascertainment of a fair return should be approached as of the year 1932, with the trier looking forward, rather than from the seat in the reviewing stand erected in 1940 and looking backward to 1931.

Even today, with a splendid record of current success behind it, the investment belongs in the speculative class.

This enterprise is based on a deposit of natural gas some four thousand feet beneath the surface of the earth. It is in Texas, some one thousand miles from the consumer. Its successful operation necessitated a capital of from seventy-five to eighty-four million dollars. Its life is limited to the time when the wells will be exhausted. This would be in 1954. At least a tenth of the period was devoted to construction, during which time there was no income.

Upon such a fact statement, and notwithstanding confidence in the expert opinion of geologists, scientists, and engineers may be great, there are factors which necessitate the use of a question mark after many a fact statement or opinion.

The case was one which hardly permitted of enlightenment from expert witnesses, who gave their opinions to the Board (and to us) respecting a fair rate of return. They were overwilling, and the indifference of some of them to opinions expressed by them on other occasions lessened the weight of their evidence.

Moreover, their opinions showed differences were unavoidable and traceable to the varying influences of different factors.

Bearing in mind that our function is to review, not to make, findings of fact, and also keeping to the front the current low rates of return on all investments, and also bearing in mind that the future may bring changes by the Commission in its finding of 6½% as a fair rate of return, we conclude that there is substantial evidence to support the Commission's finding.[10]

Rate Basis.—We now approach petitioners' several contentions respecting the Commission's failure—

(a) to include a sum for going value,
(b) to fix the proper period for amortization,
(c) to make adequate allowance for future capital additions,
(d) to take 2% instead of 6½% interest on the sinking fund.

We need only discuss the first two contentions. If we accept either of them, the order must fall.

The facts are not much in dispute. Petitioners place the lowest figure for going value at $8,500,000. The Commission refused any sum for this factor.

Petitioners contend the amortization period should be fourteen years and five months. The amount to be amortized was $84,341,218. The Commission fixed the amortization period at twenty-three years and the amount to be amortized at $74.420,424.

---

[10] United Gas Public Serv. Co. v. Texas, 303 U. S. 123; West Ohio Gas Co. v. Public Utilities Com., 294 U. S. 63; Driscoll v. Edison Light Co., 307 U. S. 104; Smith v. Ill. Bell Tel. Co., 282 U. S. 133; United Fuel Co. v. Rd. Com., 278 U. S. 300; Dayton Pow. & Light Co. v. Public Utilities Com., 292 U. S. 290; West v. Chesapeake Tel. Co., 295 U. S. 662.

We are persuaded of the soundness of both of petitioners' contentions, (a) and (b).

(a) Going value.—An allowance for going value is necessitated, due to facts peculiar to this case. In the ordinary public utility case, with no unusual fact or circumstance to affect a court's consideration of it, we assume that going value, as a properly includable item in the rate base, should and would be rejected. Driscoll v. Edison Co., 307 U. S. 104, 117. Our duty, to follow the Supreme Court rulings on this and all other questions, necessitates our making all the turns in the road, both left and right, which the teaching of experience has caused our guide to blaze through new and untraveled fields of regulation of quasi-public businesses.

The factors present in the instant case, not found in the old and well-established field of public utility regulation, which affect (b) as well as (a), are: The period of petitioners' life is fixed and rather short; the natural gas field will be exhausted in '54 (the date and the fact are not in dispute). Distinguishably different is the electric light and power field where the life of the enterprise has, in some instances, already exceeded five decades and may go on growing in strength and stability indefinitely. Moreover, great uncertainty marks this 13-year period and the constancy of petitioners' natural gas wells.

Another difference is to be found in the fact that Congress had not declared its public policy to regulate petitioners' business when it started this enterprise. Nor did Congress act until one-third of petitioners' life had expired. During that period, their business was built on the theory that they must find and satisfy their customers—must act on the assumption that rates and volume of business must depend upon and find justification in the future, rather than in the present, business.

Still another difference, however, was the newness of natural gas in Chicago, and therefore the uncertainty of customers and business. Then, too, there were the difficulties incident to the engineering problems, which arose from the task of conveying natural gas one thousand miles over mountains and under rivers to unknown prospective customers. The successful and satisfactory mixing of natural with artificial gas presented, in 1932, problems which the well-established gas companies and their engineers viewed with deepest doubt and dire misgivings.

The losses of the first years supplied persuasive evidence that the investment was highly speculative and an adequate return on the capital invested depended largely upon the business acumen, the engineering skill, and administrative efficiency of their officers, to overcome these losses and develop a profit in this newly regulated industry. Under such circumstances it seems that fairness necessitates the capitalization and inclusion of such skill—aye, and hazards—as legitimately as the cost of pipes. The natural gas was valueless as it lay in the Texas wells, four thousand feet beneath the surface of the earth, over one thousand miles from Chicago. What gave it value? Not alone pipes to carry it, nor pumps to pump it. It was the courage of the investors, and their willingness to take a chance in a speculative venture, the vision to see and to forecast, the integrity of management, and the knowledge of geologists, etc., which gave to the enterprise its life; and the product of these combined factors made for a going value, which, in the realities of the business world, is justly recognized as part of the value of the investment. It is the existing fact situation peculiar to this case which calls loudly for the inclusion of a sum for going value, as such. Nor can we fairly apply the law save as we first study the facts, and get the proper setting of the natural gas industry in the utility field. The Commission has not included its equivalent in any of the items which went to make up its rate base. If allowable at all, there can be no serious objection to fixing the sum, as the petitioners contend, at $8,500,000.

The Commission argues that in fixing the value of the rate base as high as $74,420,424, it gave full recognition to petitioners' business as a going business concern. This statement is contrary to the memorandum filed by the Commission with its findings. The $74,420,424 was made up of—

Reproduction Cost New of Physical Properties	$56,302,250
Value of Gas Reserves	13,334,775
Capital additions for the period June 1, 1939 to December 31, 1942	3,808,399
Working Capital	975,000
Total Rate Base	74,420,424

The total is the amount which the Commission adopted as its rate base. It does not include going value.

Moreover, in its opinion, the Commission said, "The Companies' claim of $8,500,000 for going concern value must be disallowed. The amount obviously is an arbitrary claim, not supported by substantial evidence warranting its allowance. Its allowance would mean the acceptance of a deceptive fiction resulting in an unfair imposition upon consumers."

In the face of this statement we must assume that the Commission did not allow any sum for going value.

Period of Amortization.—Here, again, we find of dominating importance the newness and lack of precedent among the conditions similar to those found in this industry. In ascertaining petitioners' profits, the amount deducted for amortization is most important. Petitioners assert the period should be fourteen years five months—the difference between the date of these proceedings and the date when the gas will be exhausted. Respondents, on the other hand, begin their period in 1932. In other words, the Commission adopted a twenty-three year period; whereas petitioners figured on a fourteen year five month period.

In addition to the reasons for our conclusions respecting contention (a), the significance of the date when the business enterprise became subject to governmental regulation is of dominant significance. It is important, too, as bearing on the rate making power of Congress. Avoidance of conflicts with the Fifth Amendment of the Constitution is involved. Petitioners' position avoids the conflicts; respondents' creates an unavoidable clash.

Before Congress enacted this legislation in '38, petitioners were free to contract and did contract with customers on a basis which they deemed wise. After that Act passed, their business, and particularly their rates, were subject to regulation and fixation by respondents. The size of their profits depends upon their earnings for the next thirteen years. These, in turn, depend largely upon the sums allowed for amortization of the value of the property as it then existed and was then valued. Petitioners assert an annual amortization sum of $5,100,732. Respondents fixed the sum at $1,557,852.

The position we take in no wise reflects upon the wisdom of the new legislation. That legislation looks to the future protection of the public. It deals with conditions which existed at the time the legislation was enacted. It neither gave, nor took away, value to going concerns, whose lives were short and limited by fact conditions which neither the producer nor the consumer could change. For these reasons, we conclude the amortization period, for rate making purposes, should be fourteen years, five months, instead of the period of twenty-three years adopted by the Commission.

As was said in United Railways v. West, 280 U. S. 234, "It is the settled rule of this court that the rate base is present value."

See also Brooks-Scanlon Co. v. U. S., 265 U. S. 106, 123; United Fuel Gas Co. v. Railroad Com., 278 U. S. 300.

It would seem to follow logically that if the rate base is determined as of the date of the hearing the amortization period would be for the life of the property from that same date. All the cases dealing with this subject are distinguishable in at least one respect. In the instant case, the end of the period is fixed by the exhaustion of the natural gas wells. In other words, the end is near. In the ordinary electric light, gas, or water rate case, the amortization period is long—covering the life of the pipes—well-nigh a century.

In the absence of authority, it would seem fair and reasonable to fix the amortization period not earlier than the date when Congress subjected the industry to regulation.

Other attacks upon the orders are presented by the petitioners, which we believe it unnecessary to pass upon. The hearing is not completed and some findings of fact may be changed, and the proof may be so conclusive that no attack will then be made.

All such evidence will, of course, be heard and passed upon by the Commission before entering its final order.

The order of the Commission is vacated and set aside.

A true Copy:

Teste:

Clerk of the United States Circuit Court
of Appeals for the Seventh Circuit.

And on the same day, to wit: On the fourteenth day of April 1941, the following further proceedings were had and entered of record, to wit:

Monday, April 14, 1941

Court met pursuant to adjournment

Before Hon. Evan A. Evans, Circuit Judge; Hon. William M. Sparks, Circuit Judge; Hon. Walter C. Lindley, District Judge.

No. 7454

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY, PETITIONERS

vs.

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION, RESPONDENTS

Petition for Review of Interim Order of the Federal Power Commission

This cause came on to be heard on the petition of Natural Gas Pipeline Company of America and Texoma Natural Gas Company for review of an interim rate order of the Federal Power Commission, and on the transcript of the record from the Federal Power Commission, and was argued by counsel.

On consideration whereof: It is ordered and adjudged by this Court that the Order of the Federal Power Commission entered in this cause on July 23, 1940, be, and it is hereby, vacated and set aside, and that this cause be, and it is hereby, remanded to the said Federal Power Commission for further proceedings in conformity with the Opinion of this Court.

United States Circuit Court of Appeals for the Seventh Circuit

I, Kenneth J. Carrick, Clerk of the United States Circuit Court of Appeals for the Seventh Circuit, do hereby certify that the foregoing typewritten pages contain a true copy of order entered on the first day of November 1940, the Opinion filed April 14, 1941, and the Judgment entered on the same date in Cause No. 7454, Natural Gas Pipeline Company of America and Texoma Natural Gas Company, petitioners vs. Federal Power Commission and Illinois Commerce Commission, respondents, as the same remains upon the files and records of the United States Circuit Court of Appeals for the Seventh Circuit.

In testimony whereof I hereunto subscribe my name and affix the seal of said United States Circuit Court of Appeals for the Seventh Circuit, at the City of Chicago, this 12th day of June A. D. 1941.

[SEAL]

KENNETH J. CARRICK,
Clerk of the United States Circuit Court
of Appeals for the Seventh Circuit.

U. S. GOVERNMENT PRINTING OFFICE: 1941

Supreme Court of the United States

No. 265, October Term, 1941

Order allowing certiorari

Filed October 13, 1941

The petition herein for a writ of certiorari to the United States Circuit Court of Appeals for the Seventh Circuit is granted.

And it is further ordered that the duly certified copy of the transcript of the proceedings below which accompanied the petition shall be treated as though filed in response to such writ.

Supreme Court of the United States

No. 268, October Term, 1941

Order allowing certiorari

Filed October 13, 1941

The petition herein for a writ of certiorari to the United States Circuit Court of Appeals for the Seventh Circuit is granted.

And it is further ordered that the duly certified copy of the transcript of the proceedings below which accompanied the petition shall be treated as though filed in response to such writ.

U. S. GOVERNMENT PRINTING OFFICE: 1941

At a regular term of the United States Circuit Court of Appeals for the Seventh Circuit held in the City of Chicago and begun on the first day of October, in the year of our Lord one thousand nine hundred and forty, and of our Independence the one hundred and sixty-fifth.

No. 7454

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY, PETITIONERS

vs.

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION, RESPONDENTS

Petition for Review of Interim Order of the Federal Power Commission

And, to wit: On the first day of November 1940, the following further proceedings were had and entered of record, to wit:

Friday, November 1, 1940

Court met pursuant to adjournment

Before Hon. WILLIAM M. SPARKS, Circuit Judge; Hon. J. EARL MAJOR, Circuit Judge; Hon. WALTER E. TREANOR, Circuit Judge.

No. 7439—No. 7454

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY, PETITIONERS

vs.

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION, RESPONDENTS

Petition for Review of Interim Order of the Federal Power Commission

The Federal Power Commission having overruled petitioners' petition for a rehearing of this cause; and petitioners, within sixty days of that ruling having filed a written petition in this Court praying that the order of the Commission be modified or set aside in whole or in part—it is therefore ordered by this Court that the order of the Commission herein be stayed until the further order of this Court, under Section 19 of the Natural Gas Act, 15 U. S. C. 717r (c).

It is further ordered that the temporary restraining, or stay, order, pending petitioners' application for rehearing before the Federal Power Commission, issued August 30, 1940, in cause No. 7439, be and the same is hereby dissolved.

And afterwards, to wit: On the fourteenth day of April 1941, there was filed in the office of the Clerk of this Court, the Opinion of the Court, which said Opinion is in the words and figures following, to wit:

In the United States Circuit Court of Appeals for the Seventh Circuit

No. 7454—October Term, 1940, April Session, 1941

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY, PETITIONERS

vs.

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION, RESPONDENTS

Petition for Review of Interim Order of the Federal Power Commission

April 14, 1941

Before EVANS and SPARKS, Circuit Judges, and LINDLEY, District Judge.

EVANS, Circuit Judge. Presented for review is an interim order of the Federal Power Commission, directing the petitioners to reduce their rates on natural gas, so as to reflect an annual reduction in their operating revenues of not less than $3,750,000.

Petitioners own natural gas reserves in Texas. They produce the natural gas and transport it through their own pipe lines to the State of Illinois, where it is sold wholesale—90% to one customer. They produce 75% of the gas they sell and purchase the remaining 25% from another producer. They were in business for nearly eight years before the Natural Gas Act (15 U. S. C. A. Sec. 717, et seq.[1]) became effective, June 21, 1938.

---

[1] SECTION 1. (a) As disclosed in reports of the Federal Trade Commission * * * it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest.

(b) * * * this Act shall apply to the transportation of natural gas * * *, to the sale * * * of natural gas for resale for ultimate public consumption for

line to a point near Gray Junction, Oklahoma, where it sells and delivers such natural gas to petitioner Natural Gas Pipeline Company of America. At such point near Gray Junction, Oklahoma, the petitioner last named receives and purchases from petitioner Texoma Natural Gas Company three-fourths of its total market requirements and from Colorado-Interstate Gas Company one-fourth of its total market requirements, and transports such gas in interstate commerce along and through its 24 inch pipeline to Joliet, Illinois, and intermediate points, at which it sells and delivers 98% of such natural gas at wholesale to utilities which in turn resell the same to the public for
2942 domestic, commercial and industrial uses. The remaining 2% of such natural gas the petitioner last named sells directly to industrial users along its pipeline. Petitioners are operated as a single enterprise, and all the profits of the combined operations of petitioners accrue to petitioner Natural Gas Pipeline Company of America, petitioner Texoma Natural Gas Company being operated on a non-profit basis.

V.

Following the enactment of the Natural Gas Act, approved June 21, 1938, respondent Illinois Commerce Commission, purporting to act under Section 13 of the Natural Gas Act (15 U.S.C. 717 1), on or about September 23, 1938, filed with respondent Federal Power Commission a complaint alleging that the rates and charges of petitioners for natural gas sold in the State of Illinois were unjust and unreasonable, requesting that an order be entered directing petitioners to appear and show cause why the rates charged by petitioner Natural Gas Pipeline Company of America to utilities in Illinois should not be reduced, and requesting that an order be entered setting fair, just and reasonable rates for natural gas sold by said petitioner in the State of Illinois.

Respondent Federal Power Commission did not issue a rule on petitioners to show cause why their rates and charges for gas sold in the State of Illinois should not be reduced; but on or about October 14, 1938, it entered an order reciting the filing of the above mentioned complaint and instituting an investigation of petitioners to determine with respect to each of them whether their rates and charges in connection with the transportation and sale of natural gas subject to the jurisdiction of the Federal Power Commission were unjust, unreasonable, unduly discriminatory or preferential, and, in the event it should find any such rates and charges to be unjust and unreasonable, to determine and fix, by appropriate order or orders, reasonable and non-discriminatory rates and charges.

On November 16, 1938, petitioners filed an answer to said complaint of respondent Illinois Commerce Commis-
2943 sion, in which they denied that the rates or charges
for natural gas sold by petitioner Natural Gas Pipeline Company of America to utilities in the State of Illinois are unjust and unreasonable, and denied also other allegations contained in the complaint. In said answer they denied and challenged any jurisdiction, power or authority of respondent Federal Power Commission to enter any order attempting to change, modify or set aside any charge or price for natural gas sold by petitioners to utilities in the State of Illinois or elsewhere, or to substitute or prescribe any different charges or prices therefor, on the ground that petitioners constitute a single enterprise engaged in the business of owning natural gas reserves, developing same through the drilling and equipping of wells thereon, producing natural gas therefrom, transporting same through their own pipelines and facilities to points in the States of Kansas, Nebraska, Iowa and Illinois, and selling such commodity at wholesale to selected distributors and industrial consumers under private contracts; that petitioners' enterprise is of a strictly private character, not affected with a public interest in the sense that Congress would have jurisdiction, power or authority to enact legislation purporting to authorize respondent Federal Power Commission to regulate the prices and charges for which their commodity is sold. Petitioners also alleged that the Natural Gas Act, in so far as it purports to confer on respondent Federal Power Commission jurisdiction or power to change, modify or set aside the charges or prices at which petitioners sell natural gas at wholesale to distributors or to authorize it to set up and prescribe different charges or prices for such commodity, is invalid, and that any rules, regulations or orders promulgated by respondent Federal Power Commission with a view of attempting to exercise any such purported jurisdiction are null and void and unenforcible as against petitioners because the inevitable operation and effect thereof will be to deprive petitioners of their prop-

erty and liberty of contract without due process of law, in violation of the Fifth Amendment to the Constitution of the United States.

2944

VI.

On or about April 14, 1939, respondent Federal Power Commission entered an order consolidating for purposes of hearing the complaint and investigation above mentioned and setting a public hearing in the proceedings, to be held before a trial examiner, commencing on May 8, 1939.

VII.

At the opening session of the hearing beginning on May 8, 1939, counsel for respondents called to the stand two witnesses who testified concerning some of the geological, engineering and accounting issues involved. At subsequent sessions of the hearing held from time to time through the summer and fall of 1939, petitioners offered their direct testimony, calling a total of 37 witnesses. Some of these witnesses testified to the facts concerning the history and operation of petitioners' business, the enterprise and pioneering of petitioners in the planning, designing and construction of their pipelines and other facilities, the extraordinarily high stresses and pressures under which petitioners' facilities have been and are operated, the unusually high annual load factor developed and maintained by petitioners in the operation of their business, the extent of their reserves, the geological and engineering conditions under which they produce and will produce their gas through the future life of the field, the effect of the pressures and other geological conditions in the field on the productive capacity of the wells, and the additional capital outlays which petitioners must incur in the drilling and equipping of wells and in the building of field gathering lines, field compressor stations, and other facilities during the future life of the field.

Other witnesses testified to past capital outlays and replacement costs, ultimate salvage values, maintenance and operating expenses, and other necessary and proper expenses incurred and to be incurred in connection with the operation of petitioners' business, and to the sales and earnings by petitioners since the beginning of their

operations and the probable sales and earnings by
2945 petitioners in their operations in the future. Experts
testified concerning the cost of reproducing new at the present time the depreciable physical facilities now used by petitioners, the state of depreciation of the existing depreciable facilities, the net figures showing the reproduction cost new less observed depreciation, and the present fair value of petitioners' gas reserves in their depleted condition.

Experts testified to the going concern value of petitioners' properties, to the actual cost of acquiring such going concern value, and to the cost of reproducing it at the present time.

Several witnesses testified to various mechanical risks and hazards inherent in the natural gas business and to those special hazards confronting petitioners by reason of the operation of their facilities under the extremely high pressures and tensions and the topography of the country traversed by petitioners' lines. Other risks and hazards confronting generally those engaged in the natural gas business, and petitioners in particular, were pointed out in the testimony.

Other witnesses testified to the proper method of handling a sinking fund looking to its ultimate return with interest to petitioners at the time their reserves shall be exhausted, and pointed out the types of securities available for such investment and the yields which could be obtained through the investment of funds in such securities.

Petitioners caused an exhibit to be prepared and offered in evidence, summarizing the figures showing the total amount invested and to be invested, the total charges for maintenance, operations and other costs, including taxes incurred and to be incurred, the revenues received and to be received over the entire life of the project, beginning on January 1, 1932, and ending with the year 1954, the latest year through which petitioners will have gas available from their reserves under the most favorable circumstances, from which it appeared that over the whole period petitioners will have earned an amount which, after returning to them their total investment and all operating costs and
expenses, will yield them a return on their average
2946 investment of only 6.39% per annum. This exhibit
was offered as showing that, over the whole period covered by the limited life of petitioners' business, peti-

tioners' prices and charges for natural gas are not unjust and unreasonable.

Petitioners offered another exhibit, summarizing the figures showing the reproduction cost new less observed depreciation of the physical properties other than gas reserves, the present fair value of the gas reserves, the going concern value of petitioners' properties, the cost of future additional capital assets and of capital replacements, the ultimate salvage value of the properties, the necessary working capital, the expense of maintaining and operating petitioners' facilities and conducting their business in the past and in the future, the past and prospective revenues, and other pertinent figures, from which it appeared that petitioners probably will earn over the future life of their reserves, after a proper allowance for the amortization of the present value of their properties, a return on the proper rate base of 4% per annum.

Petitioners offered another exhibit showing substantially the same figures as the exhibit last described except that, as pointing to the present fair value of petitioners' properties, they showed the original cost of the present properties instead of the reproduction cost new less observed depreciation of the properties other than gas reserves and the present fair value of the gas reserves. The figures used as a basis of this exhibit show that, after setting aside an amount each year sufficient to return the present value of the properties by the time petitioners' reserves of gas are exhausted, petitioners will receive an annual return on the proper rate base of 5.1% per annum.

These exhibits, in so far as they deal with the future, were based on figures developed through the testimony of experts who testified concerning the necessary expenditures and the probable revenues during the future life of petitioners' reserves. The figures dealing with going concern value were those developed by the witnesses who testified on that subject. The annual allowance for amortization was calculated on a sinking fund formula, using the
2947 compound interest rate to which the witnesses testified as the return which petitioners could reasonably expect from the investment of their sinking fund allowances in the highest types of securities.

Four expert witnesses were called by petitioners to testify on the subject of rate of return. These witnesses, after testifying at great length and after producing and introducing a large number of statistical tabulations, graphs and charts, and after testifying at length concerning the risks involved in petitioners' business and the reaction of the investing public to such risks as shown by the figures, charts and graphs contained in the exhibits produced by the witnesses, arrived at the opinion that a minimum of 8% per annum would be a fair and reasonable return to petitioners on the fair value of their property. Two of these witnesses testified that 8% would not be an adequate return and expressed their judgment that a higher rate of return would be required.

VIII.

On October 6, 1939, petitioners announced that they had concluded their direct testimony. Thereafter counsel for respondents, after cross examining seven of petitioners' witnesses, including the four experts who had testified on rate of return, called to the stand four witnesses, two of whom were employees of respondent Federal Power Commission and the other two employees of respondent Illinois Commerce Commission, who testified to statistics and produced statistical exhibits dealing with interest rates, cost of financing through issuance of securities, and other matters ordinarily offered in connection with rate of return studies. Two of these witnesses confined their testimony to statistical facts without undertaking to appraise or analyze their testimony and apply it to the subject of rate of return. Another testified to his conclusion as to the cost of refinancing petitioners' properties. The fourth witness, an employee of respondent Illinois Commerce Commission, testified to a conclusion that 6% per annum on the present fair value of petitioners' properties would be a reasonable return. These four witnesses were later cross examined by
petitioners at a session of the hearing concluded on
2948 December 14, 1939, at which session petitioners also
offered some testimony on redirect examination of two of their witnesses on rate of return. Subsequently, at a session of the hearing held on January 8, 9 and 10, 1940, petitioners offered redirect testimony by two of their witnesses on rate of return and some testimony in rebuttal of the testimony offered by respondents on that subject.

IX.

On November 7, 1939, at the conclusion of the direct examination by counsel for respondents of their four witnesses who testified on the subject of rate of return, but prior to the cross-examination of such witnesses by petitioners and prior to the offering of any redirect or rebuttal testimony by petitioners on the subject of rate of return, counsel for respondents filed with the Examiner as a part of the record a motion for an immediate interim order by respondent Federal Power Commission setting up rates and charges that would operate to reduce the revenues of petitioners by a sum of $3,000,000 to $3,500,000 annually. At the time such motion was offered, counsel for respondents announced that they were not resting their case. In the motion counsel for respondents stated that the cross-examination of petitioners' witnesses, the introduction of respondents' evidence, the taking of petitioners' rebuttal evidence and cross-examination thereon will consume much additional time, so that the closing of the case will be delayed for a long time in the future.

X.

Pursuant to the direction of respondent Federal Power Commission, said motion for interim order was set for argument before respondent Federal Power Commission as a whole on December 18, 1939, on which date petitioners appeared and filed pleas to the jurisdiction of respondent Federal Power Commission to enter an interim order, and also a conditional answer in reply to said motion for interim order. Respondent Federal Power Commission denied a request by petitioners that they be permitted to present their pleas to the jurisdiction before the hearing on the motion and that they be allowed to open and 2949 close the argument on such pleas. In that connection counsel for petitioners pointed out to said respondent that they had had no opportunity to prepare themselves for argument on the merits of the motion, due to the circumstance that they had been continuously engaged in preparing and offering their testimony before the Examiner from the time said motion was filed. Counsel for respondents presented their arguments in support of the motion for interim order and petitioners were heard in reply on their pleas to the jurisdiction. On the same date petitioners filed their brief in support of their pleas to the jurisdiction.

Later counsel for respondents filed their briefs in support of the motion and petitioners filed their brief in reply.

No further proceedings were had in the hearing subsequent to January 10, 1940, until July 23, 1940, on which date respondent Federal Power Commission issued a written opinion and an interim order, which it caused to be served on petitioners on August 1, 1940, the effect of which was to direct petitioners, prior to August 15, 1940, to file new schedules of rates and charges for gas sold at wholesale which would operate to reduce petitioners' net revenues available for amortization and return by the sum of at least $3,750,000 per annum, which new rates and charges should be effective as to all bills regularly rendered on or after September 1, 1940. Prior to the issuance of such opinion and order petitioners had no notice of the contents or effect thereof, no report of the Examiner to respondent Federal Power Commission on the issues of law or of fact ever having been submitted to petitioners.

XI.

On August 8, 1940, petitioners filed with respondent Federal Power Commission their verified motion for a stay of the order of said respondent dated July 23, 1940, pending the filing of petitioners' motion for rehearing and the action of said respondent thereon. On the same date said respondent entered an order denying said petition in all things except that the time for the filing of new schedules of rates and charges was extended to on or before September 1, 1940.

2950

XII.

On August 19, 1940, petitioners filed with respondent Federal Power Commission their application for rehearing, in which they set forth specifically the grounds upon which said application was based.

XIII.

On the 6th day of September, 1940, said respondent entered an order denying petitioners' application for rehearing, which order was served on petitioners on September 9, 1940.

XIV.

Pursuant to Section 19(b) of the Natural Gas Act (15 U. S. C. 717r(b)), petitioners present their petition for a review of said order of respondent Federal Power Commission issued July 23, 1940, as modified by the order of said respondent dated August 8, 1940, together with a statement of the points upon which petitioners rely as grounds for a decree of this Court reversing, setting aside and annulling said order of respondent Federal Power Commission. All the points submitted herewith as grounds for reversing, setting aside and annulling said order were urged before respondent Federal Power Commission in the application for rehearing submitted by petitioners to said respondent as aforesaid. Reference is here made to the statement of points attached hereto, which is made a part of this petition.

XV.

For the reasons expressly set forth in the statement of points attached hereto, said order of respondent Federal Power Commission, as modified, is erroneous and operates, and will continue to operate, to confiscate petitioners' property, property rights and revenues and to take petitioners' property, property rights and revenues without due process of law, in violation of the due process clause of the Fifth Amendment to the Constitution of the United States; and, for the reasons set forth in said statement of points, said order, as modified, should be reversed, set aside and held for naught.

2951 Wherefore petitioners pray:

(a) That a copy of this petition forthwith be served upon some member of respondent Federal Power Commission in pursuance of Section 19(b) of the Natural Gas Act (15 U. S. C. 717r(b)), and upon respondent Illinois Commerce Commission;

(b) That respondent Federal Power Commission be required, in conformity with the Natural Gas Act, to certify and file with the Court a transcript of the record upon which the order complained of in this petition was entered, including the testimony, evidence and exhibits admitted, pleadings, opinion, findings, conclusions, and orders of said respondent in the proceedings above referred to;

(c) That this Honorable Court review the proceedings, including the testimony, evidence and exhibits admitted, pleadings, opinion, findings, conclusions and orders in the proceedings out of which the said order of July 23, 1940, issued;

(d) That said order of July 23, 1940, in so far as it purports to direct that the rates and charges made, demanded or received by petitioners for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption shall be reduced to reflect a reduction of not less than $3,750,000 per annum in the operating revenues of petitioner Natural Gas Pipeline Company of America, and in so far as it, as modified, directs that petitioners shall file on or before September 1, 1940, new schedules of rates and charges which shall reflect such reduction in operating revenues, be reversed, set aside and held for naught;

(e) That this Honorable Court exercise its jurisdiction over the parties and subject matter of this petition and grant to petitioners such other and further relief in the premises as the rights and equities of the cause may show to be necessary and proper.

2953 In the United States Circuit Court of Appeals

For the Seventh Circuit,

October Term, 1940.

Natural Gas Pipeline Company of America and Texoma Natural Gas Company,
Petitioners,
vs.
Federal Power Commission and Illinois Commerce Commission,
Respondents.

No. ....

STATEMENT OF POINTS.

To Said Honorable Court:

Pursuant to Paragraph 3 of Rule 36 of this Court, petitioners, Natural Gas Pipeline Company of America and Texoma Natural Gas Company, in connection with their petition for review of an order of respondent Federal Power Commission dated July 23, 1940, as modified by an order dated August 8, 1940, file the following statement of points on which they rely as grounds for reversing and setting aside said order. These points, numbered consecutively from 1 to 37, inclusive, were all urged in the same order as objections or assignments of error before respondent Federal Power Commission in petitioners' application for rehearing filed with said respondent on August 19, 1940.

Respondent Federal Power Commission will be referred to hereafter as the Commission; and respondent Illinois Commerce Commission will be referred to as complainant.

2954

Point 1.

The Commission erred in holding that it has authority under the Natural Gas Act to change, modify or set aside the charges and prices at which petitioners are selling natural gas in interstate commerce at wholesale, it appearing from the record without contradiction that petitioners, constituting a single enterprise, are engaged in the business of owning natural gas reserves in the State of Texas, developing such reserves through the drilling and equipping of wells thereon, producing natural gas therefrom in quantities equal to three-fourths of their total market requirements, purchasing gas from others in quantities equal to one-fourth of their market requirements, transporting the gas so produced and purchased through their own pipelines and facilities to points in the States of Kansas, Nebraska, Iowa and Illinois, and selling such commodity at wholesale to selected distributors and industrial consumers under private contracts; that their business is of a strictly private character, not affected with a public interest in the sense that Congress would have jurisdiction, power or authority to enact legislation purporting to authorize the Commission to regulate the charges or prices for which such commodity is sold; and that the necessary operation of any order purporting to reduce, change or modify such charges would deprive petitioners of their property and liberty of contract without due process of law, in violation of the Fifth Amendment to the Constitution of the United States. (Commission's memorandum opinion No. 49, p. 9; Commission's order reducing rates, finding No. 6, p. 3.)

Point 2.

The Commission erred in overruling petitioners' second plea to the jurisdiction of the Commission dated December 18, 1939, and in holding that it has jurisdiction under the Natural Gas Act to reduce the prices at which petitioners are selling natural gas, by interim order or otherwise, pending the final termination of the proceedings and hearing now pending before the Commission and its Examiner, and pending a finding by the Commission, after the conclusion of the hearing and after petitioners have had an opportunity to be heard on their briefs and arguments on the facts presented by the whole record and the law applicable thereto, that the rates and prices charged and collected by petitioners are unjust, unreasonable, unduly discriminatory or preferential. (Commission's memorandum opinion No. 49, pp. 10-13.)

Point 3.

The Commission erred in holding that under the Natural Gas Act it has power and jurisdiction to enter an interim order pending the final termination of the hearing now pending and an opportunity by petitioners to be heard by brief and oral argument on the law and the facts presented by the whole record, since no such power or jurisdiction is conferred upon the Commission by the Natural Gas Act, either in express terms or by necessary implication. (Commission's memorandum opinion No. 49, pp. 10-13.)

2955

Point 4.

The Commission erred in holding that in these proceedings petitioners have had a hearing within the meaning of Section 5(a) of the Natural Gas Act (15 U.S.C., 717d(a)), which provides that "whenever the Commission, after a hearing * * * shall find that any rate, charge, * * * is unjust, unreasonable, * * * the Commission shall determine the just and reasonable rate, charge, * * * and shall fix the same by order." (Commission's memorandum opinion No. 49, pp. 10-13.)

Point 5.

The Commission erred in denying the request of petitioners that the issues of fact and of law raised by the motion on which the Commission's order of July 23, 1940, is based and by the briefs in support thereof be referred to the Examiner for a very careful analysis and consideration after receiving briefs and oral argument from counsel for the interested parties, and that the Commission have the formal recommendations of the Examiner on the issues, both of fact and of law, and the exceptions of petitioners thereto, if any, before the Commission should consider the entering of an interim order reducing petitioners' revenues.

Point 6.

The Commission erred in not holding that the burden of proof rests upon complainant and counsel for the Commission to establish that petitioners' existing charges are unjust and unreasonable, and that such burden has not been discharged.

Point 7.

The Commission erred in not holding that when and if complainant and counsel for the Commission discharged their burden of showing that petitioners' rates and charges are unjust and unreasonable, the burden was then upon complainant and counsel for the Commission to show what rates and charges would be just and reasonable, and that such second burden has not been discharged.

Point 8.

The Commission erred in finding that the rates and charges presently charged by petitioners are unjust, unreasonable, unlawful and violative of the provisions of the Natural Gas Act. (Commission's memorandum opinion No. 49, p. 26; Commission's order reducing rates, finding No. 18, p. 4.)

Point 9.

The Commission erred in establishing the following rate base:

2956	Reproduction cost new of physical properties (exclusive of gas reserves as of June 1, 1939)	$56,302,250
	Value of gas reserves as of June 1, 1939	13,334,775
	Capital additions from June 1, 1939, to December 31, 1942	3,808,399
	Working capital	975,000
	Rate base	$74,420,424

(Commission's memorandum opinion No. 49, p. 19; Commission's order reducing rates, finding No. 8, p. 3.)

Point 10.

The Commission erred in not allowing as the proper rate base the items and amounts set out in petitioners' reply brief dated February 15, 1940, p. 251, as follows:

Reproduction cost new exclusive of gas reserves	$56,302,250
Less "viewed" depreciation	2,866,758
Present value of physical properties exclusive of gas reserves	$53,435,492
Present value of gas reserves	13,334,775
Allowance for future capital expenditures	6,046,286
Going concern value	8,500,000
Working capital	975,000
Rate base	$82,291,553

Point 11.

The Commission erred in not holding that the proper rate base is the present value of the property, which, under the uncontradicted evidence, is made up of the reproduction cost new less viewed or actual depreciation of the depreciable properties, the value of the gas reserves, the going concern value, the working capital, and a proper allowance for future capital expenditures aggregating $82,291,553. (Defendants' reply brief dated February 15, 1940, p. 251.)

Point 12.

The Commission erred in attempting to apply its own theory as to undepreciated rate base by placing on the gas reserves the present value of those reserves in their depleted condition. (Defendants' reply brief dated February 15, 1940, pp. 144-161.)

2957

Point 13.

The Commission erred in making no allowance for going concern value in fixing the rate base and in fixing the amount to be amortized. (Commission's memorandum opinion No. 49, p. 19.)

Point 14.

The Commission erred in holding that the sum of $8,500,000 claimed by petitioners as going concern value is an arbitrary claim not supported by substantial evidence, it appearing from the uncontradicted evidence that said sum of money represents the aggregate of expenditures actually made and costs actually sustained in developing the market outlets for petitioners' gas up to the normal capacity of the lines; that such expenditures and costs were reasonable; and that at least that amount would have to be expended in attaching business if petitioners were now at the beginning of their operations. (Commission's memorandum opinion No. 49, p. 19.)

Point 15.

The Commission erred in reducing the amount allowed for future capital expenditures from $6,046,286, as claimed by petitioners, to $3,808,399, thus eliminating from the amount allowed all future capital expenditures after December 1, 1942, it appearing from the uncontradicted evidence that the amounts claimed by petitioners for capital expenditures after the date last mentioned certainly and definitely will be made and that the property acquired through such expenditures will be devoted to petitioners' business. (Commission's memorandum opinion No. 49, pp. 17, 18 and 19; Commission's order reducing rates, finding No. 8, p. 3.)

Point 16.

The Commission erred in holding that the total investment, by which it manifestly means original cost, in contradistinction to fair value, less the salvage value at the end of petitioners' business, should be amortized. (Commission's memorandum opinion No. 49, pp. 20 and 21.)

Point 17.

The Commission erred in holding that the proper amount to be amortized is $78,284,009. (Commission's memorandum opinion No. 49, p. 21; Commission's order reducing rates, finding No. 9, p. 3.)

Point 18.

The Commission erred in not holding that the proper amount to be amortized is $84,341,218, representing the present fair value of petitioners' present properties, including going concern value and working capital, plus future expenditures for additional capital assets, less the liquidating salvage value at the end of the project's life. (Commission's memorandum opinion No. 49, pp. 20-22.)

2958

Point 19.

The Commission erred in holding that the proper amortization period should be the total estimated life of the business, namely, 23 years from the beginning of 1932 to the end of 1954. (Commission's memorandum opinion No. 49, pp. 20-21; Commission's order reducing rates, finding No. 10, p. 3.)

Point 20.

The Commission erred in not holding that the proper amortization period should be the period intervening from the present time to the end of the project's life, which, under the uncontradicted evidence, will be sometime prior to December 31, 1954. (Commission's memorandum opinion No. 49, p. 20.)

Point 21.

The Commission erred in holding that the annual allowance for amortization should be calculated on a sinking fund basis, with interest credited to the amortization reserve at the rate of 6½% per annum, compounded annually. (Commission's memorandum opinion No. 49, pp. 21-22; Commission's order reducing rates, finding No. 11, p. 3.)

Point 22.

The Commission erred in not holding, under the uncontradicted evidence, that the annual allowance for amortization should be calculated on a straight line basis, or in any event on a sinking fund basis with interest credited to the amortization reserve at the rate of 2% per annum, compounded semi-annually. (Commission's memorandum opinion No. 49, pp. 21-22.)

Point 23.

The Commission erred in holding that it is fair and equitable, in computing the amortization to be charged as an operating expense under the sinking fund of formula, to use an interest rate of 6½%, the allowed rate of return. (Commission's memorandum opinion No. 49, pp. 21-22.)

Point 24.

The Commission erred in not holding that in computing the annual reserve for amortization an interest rate of not more than 2% per annum, compounded semi-annually, should be used. (Commission's memorandum opinion No. 49, pp. 21-22.)

Point 25.

The Commission erred in holding that as an annual reserve for amortization the sum of only $1,557,852 should be allowed. (Commission's memorandum opinion No. 49, pp. 22 and 26; Commission's order reducing rates, finding No. 12, p. 3, and finding No. 14, p. 4.)

2959

Point 26.

The Commission erred in not holding that the proper annual allowance for amortization is at least $5,100,732.

Point 27.

The Commission erred in eliminating from the allowance for operating expenses the items representing replacements of capital assets subsequent to August 1, 1940, in an amount averaging $188,054 per annum. The estimated cost of these items is included in the $78,284,009 erroneously allowed by the Commission as the proper amount for amortization. However, in estimating petitioners' average income available for amortization and return for the period from August 1, 1940, to and including December 31, 1942, the Commission disregarded the estimated cost of replacements during that period. Petitioners point out that the Commission failed to include such costs among the operating expenses, thus under its own theory arriving at an amount $188,054 greater than the correct amount available for amortization and return under such theory.

Point 28.

The Commission erred as a matter of law in finding that 6½% per annum on the rate base allowed is a fair rate of return for petitioners, there being no substantial evidence to support the finding. The allowed rate of return purports to cover only the cost of capital, based on the testimony of an employee of the Commission whose conclusion on that point is not supported by his own factual premise. No allowance is made for efficiency and skill in design and engineering, through which petitioners are able to operate their facilities under extraordinarily high stresses and to transport gas at extraordinarily high pressures, and efficiency in management in attaining and maintaining an average load factor more than 30% higher than that ordinarily attained by other pipelines, which efficiency and skill account for at least $1,200,000 of petitioners" annual revenues, according to the uncontradicted testimony. (Commission's memorandum opinion No. 49, pp. 23-26; Commission's order reducing rates, finding No. 13, p. 3.)

Point 29.

The Commission erred in not finding that the fair rate of return for petitioners is not less than 8%.

Point 30.

The Commission erred in holding that the annual amount necessary for a fair return to petitioners is not more than $4,837,328 and that the proper allowance for amortization is $1,557,852, or a total of $6,395,180 for fair return and amortization. (Commission's memorandum opinion No. 49, p. 26; Commission's order reducing rates, finding No. 14, p. 4.)

2960

Point 31.

The Commission erred in finding that petitioners' annual net revenues available for amortization and return exceed the amount reasonably necessary by $2,966,852. (Commission's memorandum opinion No. 49, p. 26; Commission's order reducing rates, finding No. 16, p. 4.)

Point 32.

The Commission erred in ordering that the rates and charges made, demanded or received by petitioners in connection with their transportation and sale of natural gas shall be reduced to reflect a reduction of not less than $3,750,000 per annum in the operating revenues of Natural Gas Pipeline Company of America. (Commission's memorandum opinion No. 49, p. 26; Commission's order reducing rates, paragraph (A), p. 4.)

Point 33.

The Commission erred in finding that the rates and charges after reflecting the reductions ordered will be just and reasonable. (Commission's order reducing rates, finding No. 19, p. 4.)

Point 34.

The Commission erred in ordering that petitioners file new schedules of rates and charges to reflect a reduction of not less than $3,750,000 per annum in the operating revenues of Natural Gas Pipeline Company of America effective as to all bills regularly rendered on or after September 1, 1940. (Commission's order reducing rates, paragraph (B), p. 4; Commission's order dated August 8, 1940, paragraph (A).)

Point 35.

The Commission erred in ordering that from and after the effective date of the new schedules ordered to be filed petitioners shall cease and desist from making, demanding or receiving any rates and charges which do not reflect the reduction ordered in Paragraph (A) of the Commission's order reducing rates. (Commission's order reducing rates, Paragraph (D), p. 5.)

Point 36.

The Commission erred in denying petitioners' application for a stay of the Commission's order dated July 23, 1940, pending the filing of an application for rehearing and the disposition of such application, and, in the event such application be denied, pending the review of said order by the courts on appeal. (Defendants-respondents' motion for stay filed August 8, 1940; Commission's order denying in part the motion for stay, dated August 8, 1940, Paragraph (b).)

Point 37.

The Commission erred in denying petitioners' application for rehearing. (Commission's order dated September 6, 1940.)

2961 Respectfully submitted,

STIPULATION FOR PRINTED RECORD.

Now come Natural Gas Pipeline Company of America and Texoma Natural Gas Company, petitioners, and the Federal Power Commission and Illinois Commerce Commission, respondents, and stipulate as follows:

The following documents shall be included in the printed record:

1. Pages 3 to the end of line 1 on page 64 of the official stenographer's report before the Federal Power Commission in Docket Nos. G-109 and G-112, now on file with this Court.

2. Pages 1 to 899, inclusive, of the narrative statement captioned "Abstract of Testimony."

3. Pages 4243, beginning with line 18, to page 4266, ending with line 6, of the official stenographer's report referred to in Paragraph 1 above.

4. Pages 900 to 1533, ending with line 20, of the narrative statement referred to in Paragraph 2 above.

5. Pages 8077, beginning with line 10, to page 8084, ending with line 2, of the official stenographer's report referred to in Paragraph 1 above.

6. Pages 1534 to 1816, ending with line 13, of the narrative statement referred to in Paragraph 2 above.

7. Pages 9736, beginning with line 12, to page 9740, ending with line 13, and pages 9890, beginning with line 21, to page 9892, ending with line 18, of the official stenographer's report referred to in Paragraph 1 above.

8. Pages 1816, beginning with line 14, to page 1922, inclusive, of the narrative statement referred to in Paragraph 2 above.

9. Pages 10390, beginning with line 14, to page 10394, ending with line 2, of the official stenographer's report referred to in Paragraph 1 above.

10. The letter dated January 20, 1940, by the Examiner sustaining the objection of counsel for the Commission and complainant to petitioners' (defendants') offer in evidence of the material shown at pages 10390 to 10394 of the official stenographer's report.

11. Pages 1923 to 1936, inclusive, of the narrative statement referred to in Paragraph 2 above.

12. Motion for interim order filed with the Commission by counsel for complainant and the Commission on November 7, 1939.

13. Pleas to the jurisdiction of the Commission filed by petitioners (defendants) with the Commission on December 18, 1939.

14. Conditional answer to motion for interim order filed with the Commission by petitioners (defendants) on December 18, 1939.

15. Opinion and order of the Commission dated July 23, 1940.

16. Motion for stay filed by petitioners (defendants) with the Commission on August 8, 1940.

17. Objections of Illinois Commerce Commission to granting of respondent's motion for a stay of the Commission's order of July 23, 1940, filed August 23, 1940.

18. Order of the Commission dated August 8, 1940.

19. Application for rehearing filed by petitioners (defendants) with the Commission on August 19, 1940, including verification filed August 23, 1940.

20. Order of the Commission overruling application for rehearing entered September 6, 1940.

21. Petition for review filed in this court on September 11, 1940, in cause No. 7454.

22. Exhibits Nos. 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 28, 36, 41, 43, 44, 53, 54, 78, 79, 84, 85, 86, 92, 114, 116, 117, 122, 123, 124, pages 1, 2 and 3 of 125, 129, 130, summary sheet of 131, 132, 133, 134, 136, 137, 138, 140, 141, 142, 145, 146, 147, 148, 149, 150, 151, 152, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 167, 168, 169, 170, 171, 172, 173, 174, 176, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 191, 192, 193, 195, 196, 197, 198, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, and 211.

23. This stipulation.

It is expressly stipulated that in the event any of the parties hereto shall find it necessary or proper to appeal to the official transcript filed with the Court by the Commission, the filing of this stipulation and the printed record in pursuance hereof shall in no wise prejudice its right to do so. In the event of controversy as to construction of any part of the narrative included in the record to be printed, it is expressly stipulated that the official transcript shall govern.

SUPPLEMENTAL STIPULATION FOR PRINTED RECORD.

Now come Natural Gas Pipeline Company of America and Texoma Natural Gas Company, petitioners, and the Federal Power Commission and Illinois Commerce Commission, respondents, and stipulate that the following portions of the Exhibits to be printed pursuant to the Stipulation for Printed Record filed in this court on November 6, 1940, shall be omitted:

1. Picture and name and all material except the lower

half of columns 2 and 3, beginning with printed matter entitled, "Expanding Markets for Gas Industry Make Investments Sound" in Exhibit No. 170.

2. All of column 1, page 3 (numbered 37) in Exhibit No. 171.

3. The picture and name on page 1; the lower half of columns 1 and 2 beginning with title "Transparent Kitchen To Use Gas," the paragraph in column 2 entitled, "Name Change", and all of column 3 including the picture, on page 2 in Exhibit No. 172.

4. All of page 3 except article continued on lower half of column 3 entitled, "A Stock Broker Analyzes The Natural Gas Industry," in Exhibit No. 173.

5. Picture and name on page 1 and all of material in columns 2 and 3 under title of "Plumber-Utility Cooperative Sales in Connecticut Drop in 1938," in Exhibit No. 176.

6. All of page 2 (numbered 33) except the article continued in the lower half of columns 2 and 3 under the title of "Investment Opportunities," in Exhibit No. 178.

No. ——

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION, PETITIONERS

v.

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY

PETITION FOR A WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT

The Solicitor General, on behalf of the Federal Power Commission, and the Attorney General of Illinois, on behalf of the Illinois Commerce Commission, pray that a writ of certiorari issue to review the judgment of the United States Circuit Court of Appeals for the Seventh Circuit, entered in this case on April 14, 1941, vacating and setting aside an order of the Federal Power Commission reducing the rates charged by the respondents.

OPINIONS BELOW

The opinion of the Circuit Court of Appeals (R. 4026–4041) is not yet reported. The memorandum opinion of the Federal Power Commission is found at R. 3925-3942.

JURISDICTION

The judgment of the Circuit Court of Appeals was entered on April 14, 1941 (R. 4041). The jurisdiction of this Court is invoked under Section 240 (a) of the Judicial Code, as amended by the Act of February 13, 1925.

QUESTIONS PRESENTED

1. Whether, in issuing a rate order under the Natural Gas Act, the Federal Power Commission is required to include within the rate base a separate allowance for "going-concern value."

2. Whether, in determining the annual allowance for amortization, the Commission may compute the allowance on the basis of the entire service life of the capital assets or only on the basis of the remaining life from the date of the passage of the Natural Gas Act of June 21, 1938, or from the date of the rate order.[1]

---

[1] A third question, which is reserved for argument on the merits if this petition be granted, is whether, on judicial review of a rate order of the Commission under Section 19 (a) of the Natural Gas Act, the order may be vacated for failure to make an allowance or adequate allowance for certain items of value or cost, in the absence of a finding that the rates permitted by the order are confiscatory, unjust, or unreasonable.

STATUTE INVOLVED

The pertinent provisions of the Natural Gas Act of 1938, c. 556, 52 Stat. 821, 15 U. S. C., Supp. V, §§ 717–717w, are set forth in the Appendix.

STATEMENT

The respondent companies are operated as a single enterprise (R. 11, 3999). They own and operate, and originally constructed, a natural gas pipe line, running from Texas and Oklahoma to Illinois (R. 3998). Three-quarters of the gas transported through the pipe line is produced from the respondents' own gas reserves in the Texas Panhandle, and one-quarter, produced in the same field, is purchased from a third company (R. 3998–3999). This gas is transported through the pipe line in interstate commerce, and 98% of it is sold at wholesale to utility companies which resell to the public for domestic, commercial, and industrial use (R. 3998–3999).[2] The respondents have their principal places of business in Chicago, Illinois (R. 1, 9). There is no dispute as to these facts and no question is raised that respondents are engaged in interstate commerce (cf. R. 4010).

The Natural Gas Act of 1938 declares that the "business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest," and that federal regulation of interstate commerce in gas is "necessary in the public interest" (Sec. 1 (a)). The Act requires that all rates and charges in connection with the transportation or sale of gas subject to the Act must be "just and reasonable," and declares any rate or charge that is not just and reasonable to be unlawful (Sec. 4 (a)). The Federal Power Commission, on its own motion or on the complaint of a state, municipality, state commission, or gas distributing company, is empowered to investigate the rates charged, and to determine just and reasonable rates; the Commission "may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates" (Sec. 5 (a)).

---

[2] About 90% of the gas is sold to an affiliated pipe line company in Illinois which resells to affiliated utility companies (R. 2–3, 9).

On September 23, 1938, the Illinois Commerce Commission, pursuant to sections 5 (a) and 13 of the Act, filed with the Federal Power Commission a complaint charging the respondent gas companies with exacting unjust and unreasonable rates and praying for an order determining fair, just, and reasonable rates (R. 1–6). On October 14, 1938, the Federal Power Commission itself instituted an investigation of respondent's rates (R. 6–9). After answer denying most of the material allegations of the complaint (R. 9–12) the two proceedings were consolidated for hearing (R. 13–14).

Hearings were begun on May 8, 1939, and continued intermittently for over five months, sessions being held on some 56 days (R. 3994–3995). Respondents fully presented their case, producing 37 witnesses (R. ii–iii; 187–1976) who testified on every phase of the business. On October 6, 1939, counsel for respondents announced that they had concluded their direct testimony (R. 4004). Thereafter seven of their witnesses were cross-examined and reexamined, and counsel for the two commissions presented four witnesses, who testified largely on the proper rate of return (R. 4004). On November 7, 1939, counsel for the two commissions jointly moved, on the evidence then of record, and without closing their case, for an immediate interim order reducing the rates (R. 3903–3914). Thereafter hearings were held at which respondents cross-examined the Commission's witnesses, and presented redirect and rebuttal testimony of their own, also mainly on the rate of return (R. 4004–4005, 3927). The final record before the Commission comprised 211 exhibits and over 10,500 pages of transcript of testimony. Oral argument on the motion was had before the full Commission and respondents filed pleas to the jurisdiction of the Commission to enter the requested order (R. 3914–3919), as well as an answer on the merits (R. 3920–3924), and briefs on both points (R. 3927, 4006).

On July 23, 1940, the Commission issued its memorandum opinion (R. 3925–3942) and an interim order reducing rates (R. 3942–3946). After making subsidiary and ultimate findings, including a finding that the companies' rates were "unjust, unreasonable and excessive" (R. 3945), the Commission ordered the respondents to reduce their rates sufficiently to reflect a reduction of at least $3,750,000 per annum in operating revenues, and to file new schedules of rates carrying into effect this reduction (R. 3945–3946). The order also provided that the record was to "remain open for such further proceedings as the Commission may deem necessary or desirable" (R. 3946).

For the purposes of the interim order, the Commission "reluctantly" accepted (R. 3936) the following estimates presented by respondents' own witnesses:

Reproduction Cost New of Physical Properties (exclusive of Gas Reserves)	$56, 302, 250
Value of Gas Reserves as of June 1, 1939	13, 334, 775
Capital Additions from June 1, 1939, to December 31, 1942	3, 808, 399
Working Capital	975, 000

These items total $74,420,424, which the Commission adopted as the rate base (R. 3937, 3944). The rate base urged by the companies was $82,291,553 (R. 3935). The companies' own recorded book cost of the properties, plus working capital, in existence as of December 31, 1939, was $60,952,279 (R. 3937).

The Commission refused to include in the rate base two items urged by the respondents: $8,500,000 for "going concern" value and $2,237,887 for average future capital expenditures from 1943 to 1954, the date claimed by the respondents for the exhaustion of their gas reserves and the termination of their business. The Commission characterized the claim for an allowance for "going concern" value as "arbitrary" and a "deceptive fiction", and added that it was convinced that it was allowing in the rate base "more than an adequate amount to cover all elements of value", and that the rate base allowed was "liberal" (R. 3936–3937).

The Commission fixed 6½% as the fair rate of return (R. 3938–3940).

The Commission accepted the companies' own estimate of the life of their business, 23 years (1932–1954), and their figures for total past and future capital expenditures, less salvage, $78,284,009 (Exh. 140, R. 3021).[3] From this it calculated the annual allowance for amortization to be $1,557,852, using the sinking fund method, with interest at 6½% per year, compounded annually (R. 3937–3938). The term "amortization allowance" was used to mean the allowance for depreciation, depletion, and retirement expense (R. 3937).

---

[3] This total may be reconciled with the recorded book cost of the companies' properties plus working capital, in the sum of $60,952,279 as of December 31, 1939, as follows (in round figures):

Book cost of existing properties plus working capital at December 31, 1939	$60,950,000	(R. 3937)
Retirements actually made (1932–1939)	6,650,000	(R. 2959, 2821)
Future capital additions (1940–1954) per companies' estimates	8,535,000	(R. 3025, 2821)
Future capital replacements and contingencies (1940–1954) per companies' estimates	3,200,000	(R. 3027, 3021)
Total	79,335,000	
Less salvage, per companies' estimate	1,050,000	(R. 3021)
	78,285,000	

Pursuant to section 19 (a) of the Act, the companies filed an application for a rehearing (R. 3961–3993). Upon the denial of this application (R. 3993–3994), respondents petitioned the Circuit Court of Appeals for the Seventh Circuit for a review of the Commission's order (R. 3997–4009). The Circuit Court of Appeals upheld (1) the validity of the Natural Gas Act under the Fifth Amendment, (2) the authority of the Commission to issue an interim order reducing rates, (3) the propriety of setting 6½% as the fair rate of return, and (4) the propriety of putting the initial burden of setting up the rate schedules upon the companies. The court below vacated the Commission's order, however, on the sole grounds (a) that a separate allowance for "going concern value" of $8,500,000 should have been included in the rate base, and (b) that the period of amortization chosen should not have been the entire life of the business, but rather either the period beginning with the passage of the Act or the period commencing with the date of the rate reduction order. The court made no finding that the reduction would result in unjust, unreasonable, or confiscatory rates.[4]

---

[4] The court found it unnecessary to consider two other grounds of attack urged by respondents: (i) that capital additions from 1943 to 1954 should have been included in the rate base, (ii) that 2% instead of 6½% interest should have been used in calculating the amortization allowance.

REASONS FOR GRANTING THE WRIT

1. The decision below requiring a separate allowance of $8,500,000 for going-concern value is in conflict with the decisions of this Court. This Court has repeatedly held that a separate allowance for going-concern value is not required in a rate valuation where, as here, the physical assets have been appraised "as part of an assembled whole." *Columbus Gas & Fuel Co.* v. *Public Utilities Commission,* 292 U. S. 398, 411; *Driscoll* v. *Edison Co.,* 307 U. S. 104, 117; *Denver Union Stock Yard Co.* v. *United States,* 304 U. S. 471, 478–480; *St. Joseph Stock Yards Co.* v. *United States,* 298 U. S. 38, 62–4; *Dayton Power & Light Co.* v. *Public Utilities Commission,* 292 U. S. 290, 308–9; *Los Angeles Gas & Electric Corp.* v. *R. R. Comm'n,* 289 U. S. 287, 313–319; *Galveston Elec. Co.* v. *Galveston,* 258 U. S. 388, 393–7; *Des Moines Gas Co.* v. *Des Moines,* 238 U. S. 153.[5] Moreover, the going-

---

[5] Ample evidence that the rate base adopted did and was intended to reflect the value of the physical property "as part of an assembled whole" is found in the Commission's adoption, as its basis of valuation, of respondents' estimate of reproduction cost, which was $13,500,000 in excess of the original investment (R. 3937) and which included, in addition to labor and material costs, large allowances for overheads, such as interest, taxes, and administrative, legal, supervisory and "preliminary operations" (R. 1224–1231, 1234), and the Commission's declaration, in rejecting the companies' claim for a separate allowance for "going concern value," that the rate base included "more than an adequate amount to cover all elements of value" (R. 3936–3937). The opinion below states (R. 4039) that the Commission did

concern allowance approved by the court below was calculated on the basis of interest and return assumed to have been unearned in the past and other deficiencies in past earnings, previously included in operating expenses, during the period of business development (R. 1276–1282; 1327–1337; 2943–2947), a method which this Court has specifically condemned. *Galveston Elec. Co.* v. *Galveston,* 258 U. S. 388, 393–397; *Columbus Gas & Fuel Co.* v. *Public Utilities Commission,* 292 U. S. 398, 411–413.

The court below correctly assumed that, under the decisions of this Court, going concern value need not be included as an item in the rate base "in the ordinary public utility case" (R. 4038). It distinguished the instant case upon the grounds that the life of respondent's business is fixed and rather short, that the investment is speculative, and that in the early years respondent had not been subjected to federal regulation (R. 4038–4039). The distinctions are without substance. The life span of the business and its speculative nature are relevant only to the period to be used as a basis in the determination of the annual amortization allowance, and to the fair rate of return (see *Galveston Elec. Co.* v. *Galveston,* 258 U. S.

---

not include going value, as shown by the Commission's findings as to the composition of the rate base and the reasons which it assigned for rejecting the companies' claim for a separate allowance for "going-concern value." Quite evidently, however, this means only that the Commission failed to make a separate allowance for going-concern value.

388, 395–396), and the absence of federal regulation prior to the passage of the Natural Gas Act has no conceivable relation to the valuation of the physical assets, whether the appraisal be based on "present value" or investment.

The question whether a separate allowance must be made for going concern value is one of substantial importance in the administration of the Natural Gas Act of 1938. This is the first rate proceeding under the Act to reach the courts. There are now pending before the Federal Power Commission natural gas rate cases, in various stages of investigation and hearing, involving companies with properties valued at about one billion dollars, and whose annual revenues total several hundred million dollars, and other proceedings will no doubt be instituted in the future. The weight to be given the element of going concern value must necessarily be determined in every case. The Commission has assumed that, under the decisions of this Court, an appraisal of the property as "part of an assembled whole" was sufficient. The court below has now held that these decisions are limited to the "old and well-established field of public utility regulation" (R. 4038). In concluding that a different result was required in the case of respondent, the court below deemed it necessary to "blaze through new and untraveled fields of regulation of quasi-public businesses" (R. 4038) in view of the "newness and lack of precedent among the conditions similar to those found in this industry" (R. 4039). The factors which were thought to require this conclusion, the life span of respondent's business, its speculative character and the absence of federal regulation in the early years, may be found in similar measure in the case of substantially all utilities subject to the Natural Gas Act. Whether such a far-reaching departure from the principles heretofore established in other fields of utility regulation is required in the case of the natural gas industry is a question which should be authoritatively determined by this court.

2. The decision of the court below (R. 4039-4041) that the period used as one of the bases in determining the annual amortization allowance must not include the years prior to the enactment of the Natural Gas Act likewise presents a novel question of vital importance in the administration of the Act. With immaterial exceptions, the utilities subject to the Act had all been engaged in the natural gas business for a number of years prior to the passage of the statute in 1938. If allowance must be made, in the years remaining after that date, for the amortization of the total capital investment theretofore made and the cost of past service thus charged to present consumers, effective rate regulation of the natural gas industry will be virtually nullified.

It is not clear why the court below condemned the amortization allowance. The decision perhaps was placed upon the ground that it was based on "original investment" rather than "present value" (see R. 4040), and perhaps on the ground that an amortization allowance which assumed the maintenance of reserves prior to regulation was retroactive legislation (see R. 4040–4041). In either case, these are considerations which would apply in every rate proceeding under the Natural Gas Act.

The effect of the decision, whatever its basis, is to require a method of determining amortization or depreciation allowance which is in conflict with the prevailing practice of the industry and of the regulatory bodies[6] and which would gravely impair the effectiveness of utility regulation under the Natural Gas Act. The decision presents in aggravated form the occasion for the salutary principle that the courts "are not required to enter a debatable field of fact and to choose and prescribe an invariable method of computation." *Clark's Ferry Bridge Co.* v. *Public Service Commission,* 291 U. S. 227, 240. So far as *United Railways* v. *West,* 280 U. S. 234, is deemed to support the decision below it can no longer be regarded as controlling.[7]

[7] As indicated above (*supra,* p. 2), the Government will urge, in the event this petition is granted, that the Commission's order did not require the establishment of rates

CONCLUSION

For the foregoing reasons it is respectfully submitted that the petition for a writ of certiorari should be granted.

CHARLES FAHY,
Acting Solicitor General.
GEORGE F. BARRETT,
Attorney General of Illinois.

JULY 1941.

---

below "the lowest reasonable rates" and that the finding of the Commission that the rates permitted by the order are just and reasonable is supported by substantial evidence, with the consequence that the court below, under Sections 5 (a) and 19 (b) of the Natural Gas Act, was without authority to set aside the order of the Commission.

APPENDIX

The Natural Gas Act of 1938, C. 556, 52 Stat. 821, 15 U. S. C. Supp. V, §§ 717–717w, provides:

> SEC. 1. (a) As disclosed in reports of the Federal Trade Commission made pursuant to S. Res. 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest. (P. 821.)
>
> * * * * *
>
> SEC. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful. (P. 822.)
>
> SEC. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural gas company in

connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,* That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates. (Pp. 823–824.)

* * * * *

SEC. 6. (a) The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property.

(b) Every natural-gas company upon request shall file with the Commisison an inventory of all or any part of its property and a statement of the original cost thereof, and shall keep the Commission informed regarding the cost of all additions, betterments, extensions, and new construction. (P. 824.)

* * * * *

SEC. 9. (a) The Commission may, after hearing, require natural-gas companies to carry proper and adequate depreciation and amortization accounts in accordance with such rules, regulations, and forms of account as the Commission may prescribe. The Commission may from time to time ascertain and determine, and by order fix, the proper and adequate rates of depreciation and amortization of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas. Each natural-gas company shall conform its depreciation and amortization accounts to the rates so ascertained, determined, and fixed. * * * (P. 826.)

* * * * *

SEC. 13. Any State, municipality, or State Commission complaining of anything done or omitted to be done by any natural-gas company in contravention of the provisions of this Act may apply to the Commission by petition, which shall briefly state the facts, whereupon a statement of the complaint thus made shall be forwarded by the Commission to such natural-gas company, which shall be called upon to satisfy the complaint or to answer the same in writing within a reasonable time to be specified by The Commission. (P. 827.)

* * * * *

SEC. 19. (a) Any person, State, municipality, or State commission aggrieved by an order issued by the Commission in a proceeding under this Act to which such person, State, municipality, or State commission is a party may apply for a rehearing within thirty days after the issuance of such order. The application for rehearing shall set forth specifically the ground or grounds upon which such application is based. Upon such application the Commission shall have power to grant or deny rehearing or to abrogate or modify its order without further hearing. Unless the Commission acts upon the application for rehearing within thirty days after it is filed, such application may be deemed to have been denied. No proceeding to review any order of the Commission shall be brought by any person unless such person shall have made application to the Commission for a rehearing thereon.

(b) Any party to a proceeding under this Act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. * * * No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission, and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in sections 239 and 240 of the Judicial Code, as amended (U. S. C., title 28, secs. 346 and 347). (Pp. 831–832.)

E. Action of the court below 15

F. Contentions of the parties 16

Specification of errors to be urged in No. 265 17

Summary of argument 18

Argument:

I. The Natural Gas Act of 1938 is a valid regulation of interstate commerce 24

II. The Natural Gas Act authorized the Commission, after granting a full hearing to the companies, to enter an interim order directing the companies to file a new schedule of rates reflecting a prescribed reduction in operating revenues 26

A. The Commission acted properly in entering an interim order on the companies' evidence 27

B. The Commission acted properly in directing the companies to file a new schedule of rates reflecting a prescribed reduction in operating revenues 30

III. The issues before this Court on the merits 32

IV. The reduction in rates ordered by the Commission does not violate the companies' constitutional rights 37

A. The Commission properly refused to make a separate allowance for going concern value 39

1. The facts with respect to the companies' claim for a separate allowance for going concern value 39

2. The controlling decisions of this Court support the Commission's denial of the companies' claim 45

Argument—Continued. Page
3. On principle, the inclusion in the rate base of an allowance for going concern value is not required by the Constitution under any permissible theory of rate regulation 54
B. The Commission made a proper allowance for amortization 68
1. The Commission properly provided for amortization of only the investment in the property 70
2. The Commission properly fixed the amortization period as the entire life of the enterprise 79
3. The Commission used a proper rate of interest in computing the amortization allowance 95
C. The Commission provided a proper rate of return 101
V. The Commission's findings that the companies' existing rates are unreasonable and that the level of rates fixed by the Commission are reasonable are supported by substantial evidence 106
VI. *Smyth* v. *Ames* is not based on sound principles and should be overruled 112
A. The fair value rule is based on eminent domain concepts 113
B. The eminent domain concept of present fair value has no place in rate regulation 116
C. Rate regulation should be deemed violative of due process only if arbitrary or unreasonable 122
D. It is not unreasonable to limit the earnings of a utility to a fair return upon the capital prudently invested 127
Conclusion 133

OCTOBER TERM, 1941

Nos. 265 and 268

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION, PETITIONERS

v.

NATURAL GAS PIPELINE COMPANY OF AMERICA, AND TEXOMA NATURAL GAS COMPANY

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY, PETITIONERS

v.

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION

ON WRITS OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT

BRIEF FOR THE FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION

OPINIONS BELOW

The opinion of the Circuit Court of Appeals (R. 4026-4041) is reported in 120 F. (2d) 625. The memorandum opinion of the Federal Power Commission appears at R. 3925-3942.

JURISDICTION

The judgment of the Circuit Court of Appeals was entered on April 14, 1941 (R. 4041). The petition and cross-petition were filed on July 12 and July 14, 1941, respectively, and were granted on October 13, 1941. The jurisdiction of this Court is invoked under Section 240 (a) of the Judicial Code, as amended by the Act of February 13, 1925.

QUESTIONS PRESENTED

1. Whether the Natural Gas Act of 1938 is a valid regulation of interstate commerce as applied to the companies here involved.

2. Whether the Commission is authorized under the Act to enter an interim order after hearing all of the companies' evidence.

3. Whether the Commission is authorized under the Act to enter an order directing the companies to file a new schedule of rates reflecting a prescribed reduction in operating revenues.

4. Whether the Commission's refusal to make a separate allowance for going concern value in fixing the rate base makes its order either confiscatory or unreasonable.

5. Whether the allowance made by the Commission for amortization makes its order either confiscatory or unreasonable, either because (a) the Commission provided for amortization of only the investment in the property, (b) it fixed the amortization period as the entire life of the enter-

prise, or (c) it used a 6½% compound interest rate to compute the allowance.

6. Whether the 6½% rate of return allowed by the Commission makes the order either confiscatory or unreasonable.

7. Whether, in determining the validity of the Commission's rate order, the Constitution is to be interpreted as requiring a fair return on the present fair value of the companies' properties or only as requiring a fair return on the companies' investment in the properties.

STATUTE INVOLVED

The pertinent provisions of the Natural Gas Act of 1938, c. 556, 52 Stat. 821, 15 U. S. C., Supp. V, §§ 717–717w, are set forth in Appendix A, *infra*, pp. 134–138.

STATEMENT

The Natural Gas Act of 1938 declares that the "business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest," and that federal regulation of interstate commerce in natural gas "is necessary in the public interest" (Sec. 1 (a)). The Act requires *inter alia* that all rates and charges in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission shall be "just and reasonable," and declares any rate or charge that is not just and reasonable to be unlawful (Sec. 4 (a)). The

Federal Power Commission, on its own motion, or on complaint of a state, municipality, state commission, or gas distributing company, is empowered to investigate the rates charged by any natural gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, and to determine just and reasonable rates, and "may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates" (Sec. 5 (a)).

A. PROCEEDINGS BEFORE THE COMMISSION

On September 23, 1938, shortly after the effective date of the Natural Gas Act,[1] the Illinois Commerce Commission, pursuant to Sections 5 (a) and 13 of the Act, filed with the Federal Power Commission a complaint charging the Natural Gas Pipeline Company of America and the Texoma Natural Gas Company (hereinafter referred to as "the companies") with exacting unjust and unreasonable rates and praying for an order "setting fair, reasonable, and just rates" (R. 1–6). On October 14, 1938, the Federal Power Commission, on its own motion, instituted an investigation of the companies' rates (R. 6–9). After answer denying most of the material allegations of the complaint (R. 9–12), the two proceedings were consolidated for hearing (R. 13–14).

---

[1] The Act was approved June 21, 1938, 52 Stat. 833.

Hearings were begun on May 8, 1939, and continued intermittently for over five months, sessions being held on some 56 days (R. 3994–3995). After preliminary testimony concerning the companies' gas reserves and their sales and rates by the Principal Gas Engineer of the Federal Power Commission (R. 35), and the presentation of earnings and expense data by an accountant employed by the Illinois Commerce Commission (R. 57), the companies complied with the direction of the Power Commission's examiner that they present their evidence first (R. 64). The companies presented 37 witnesses (R. 187–1976) who testified fully on their behalf. On October 6, 1939, the companies announced to the examiner that they had concluded their direct testimony in support of their case (R. 4004). Thereafter, seven of their witnesses were cross-examined, reëxamined, and recross-examined, and counsel for the two commissions presented four witnesses who testified largely on the subject of rate of return (R. 4004). On November 7, 1939, counsel for the two commissions joined in filing a motion on the basis of the evidence then of record, for an immediate interim order reducing the companies' alleged excessive and unlawful rates and charges (R. 2098–2100, 3903–3914). Thereafter, additional hearings were held at which the companies cross-examined the witnesses produced by the two commissions and later presented evidence on redirect and in rebuttal, also mainly on the rate of return (R. 4004–4005, 3929). Oral argument on the motion was had before the full Commission on December 18, 1939 (R. 2557, 3927), and the companies filed pleas to the jurisdiction of the Commission to enter the requested order (R. 3914–3919) as well as an answer on the merits (R. 3920–3924), and a brief on the jurisdictional issue (R. 3927, 4006). Thereafter, at the request of the companies, additional hearings were held to afford them further opportunity to present additional rebuttal testimony dealing with the issue of a proper rate of return and also to afford them opportunity to cross-examine one of the Commission witnesses who had previously given redirect testimony (R. 3927). The companies' brief on the merits was filed on February 15, 1940 (R. 3927). On July 23, 1940, the Commission issued a memorandum opinion (R. 3925–3942) and an interim order reducing rates (R. 3942–3946). That interim order is the order now under review. Its precise nature is discussed below (*infra*, pp. 11–15). A petition for rehearing filed by the companies (R. 3961–3993) was denied by the Commission (R. 3993–3994).

B. BUSINESS OF THE COMPANIES

The companies are Delaware corporations and their principal place of business is in Chicago, Illinois (R. 1). Conducted as a single enterprise (R. 11, 3944), they are engaged in producing and purchasing natural gas, transporting it in interstate commerce, and then selling it at wholesale (R. 11). Three-fourths of their market requirements are produced from their own reserves in the Panhandle gas field of Texas and one-fourth, produced in the same field, is purchased from the Colorado-Interstate Gas Company (R. 576). The companies transport their gas through their own pipeline which extends from Texas to Illinois (R. 37, 38).

About 98% of the gas transported through the pipeline is sold at wholesale to utilities which in turn resell the gas to the public for domestic, commercial, and industrial uses. The remaining 2% is sold directly to industrial users along the line (R. 2683). About 90% of the gas is sold, under contract, to an affiliated pipeline company, the Chicago District Pipeline Company, which in turn sells to affiliated utility companies (R. 2683, 2691). This contract, entered into on September 25, 1931, is to run for fifteen years and is renewable for a period of five years at the option of the Natural Gas Pipeline Company of America. The Chicago District Pipeline Company resells the gas which it purchases from the companies to the Peoples Gas Light and Coke Company, Public Service Company of Northern Illinois and Western United Gas & Electric Company. These public utilities distribute the natural gas, in most cases with a mixture of artificial gas, in the Chicago metropolitan area and northern Illinois (R. 3). They have guaranteed the contract of the Chicago District Pipeline Company with the Natural Gas Pipeline Company of America (R. 3). Several smaller distributing utilities also purchase gas from the companies for resale (R. 2683).

The construction of the companies' pipe line was commenced in 1930 and completed near the end of 1931 (R. 518, 560) and operating records were set up as of January 1, 1932 (R. 561).

Witnesses for the companies testified that the economic life of their natural gas reserves would be 23 years—1932 to 1954, inclusive—and that at the end of that period the companies would be forced to discontinue business because of exhaustion of the supply (R. 1400). For purposes of the interim order here under review, the Commission assumed that the companies' business would continue only until December 31, 1954 (R. 3938).[2]

C. FINANCIAL HISTORY OF THE COMPANIES

At the beginning of operations, the companies' capital structure consisted of \$60,000,000 of 6% bonds and \$3,500,000 of common stock. Of this \$3,500,000 of common stock, \$500,000 represents stock issued by Texoma, which is a non-profit corporation and which consequently pays no dividends on its stock (R. 3712). By December 31, 1933 the bond figure was increased to $60,999,000 (R. 2991). All of the bonds are held by six large corporations,[3] which also hold all of the stock of the companies; the bonds held by each of the six stockholder corporations are in proportion to the stock held by each (R. 3781).

---

[2] There was evidence in the record, however, that the life of the companies would be considerably longer (R. 54, 3374, 3401, 3408).

During the first seven years of operations ending on December 31, 1938, the companies built up a reserve for depreciation and depletion amounting to $12,557,892, and in addition charged $6,481,322 as operating expenses for retirements beyond the amount charged against the depreciation and depletion reserves (R. 2959). The sum thus made available was used in part to retire $14,499,000 of the bonds (R 2991). The companies also declared dividends of $9,150,000 during the first seven years (Ex. 15, R. 2749). Even allowing for book deficits in the first two years, the net income available for dividends and surplus, during the first seven years, was $8,224,436, per the books (Ex. 136, R. 2959) or an annual average of 39.3% on the capital stock of Natural Gas Pipeline Company of America. For the first eight months of 1939 that company paid $1,500,000 on its $3,000,000 stock (Ex. 187, R. 3784).

---

[3] Standard Oil Company of New Jersey, The Texas Corporation, Columbian Carbon Company, Southwestern Development Company, Cities Service Company, and Natural Gas Investment Company. The last-mentioned company is in turn owned by The Peoples Gas Light and Coke Company and Commonwealth Edison Company (Chart 4, Exhibit 186, R. 3781).

More specifically, the total actual income available for return and for amortization of investment, according to the companies' exhibits, after payment of operating expenses and taxes, during the years from 1932 to 1938, inclusive, was $53,405,092 (Ex. 136, R. 2959). During the same period a total of $19,558,810 was charged to operations for amortization of investment, consisting of $11,620,210 on account of depreciation, $1,457,278 on account of depletion, and in addition, $6,481,322 for retirements beyond the amount charged against the depreciation and depletion reserves (Ex. 136, R. 2959). Deducting the total charges of $19,558,810 from the $53,405,092 of income leaves $33,846,282 for return on investment during the period, which is an average of $4,835,183 per annum, after all actual charges made by the companies for depreciation, depletion, and retirements.

The book cost of the properties existing each year, according to the companies' balance sheets, averaged slightly more than $60,000,000 during this period, or slightly less than $61,000,000 if the companies' estimate for working capital is included (Ex. 137, R. 2991).

At the end of the period the companies had accumulated reserves of $12,557,892 for depreciation and depletion applicable to the properties in service (Ex. 137, R. 2991). If we take this figure as the companies' measure of the loss in the existing properties that occurred in the seven years by reason of depreciation and depletion, and deduct one-half of it from the undepreciated figure of $61,000,000, the average depreciated investment for the period is found to be approximately $54,720,000. The average annual income of $4,835,183 during the seven-year period was more than 8.8% of that investment (Ex. 137, R. 2993).

For the year 1938, the net earnings from operations ($9,884,745) (Ex. 136, R. 2959), after depreciation charges of $1,978,408, depletion charges of $261,658, and retirements of $992,567, as per the companies' books, amounted to $6,652,112. The actual book cost of the existing properties as of December 31, 1938, $59,197,842 (R. 2991), together with working capital as claimed by the companies of $975,000 (R. 3901), amounted to $60,172,842, or $47,614,950 after deduction of the depreciation and depletion reserves of $12,557,892 applicable to the existing properties (Ex. 136, R. 2959). The net earnings on the depreciated investment were thus almost 14% in 1938. Even without any deduction of the depreciation and depletion reserves, the return was approximately 11%. The earnings of the companies for the first eight months of 1939 were substantially larger than the corresponding earnings for 1938 (Ex. 187, R. 3784).

D. OPINION AND ORDER OF THE COMMISSION

On July 23, 1940, the Federal Power Commission issued its memorandum opinion (R. 3925-3942) and an interim order reducing rates (R. 3942-3946). After making subsidiary and ultimate findings, including a finding that the companies' rates were "unjust, unreasonable, and excessive" (R. 3945), the Commission ordered the companies to file new schedules of rates and charges reflecting a reduction of at least $3,750,000 per annum in operating revenues; these new schedules were to be effective as to all bills regularly rendered on or after September 1, 1940 (R. 3945–3946). The order also provided that the record should "remain open for such further proceedings as the Commission may deem necessary or desirable" (R. 3946).

For the purpose of the interim order the Commission "reluctantly" accepted (R. 3936) the following estimates presented by the companies' own witnesses:

Reproduction Cost New of Physical Properties (exclusive of Gas Reserves)[4]	$56,302,250
Value of Gas Reserves as of June 1, 1939	13,334,775
Capital Additions from June 1, 1939, to December 31, 1942	3,808,399
Working Capital	975,000

---

[4] Although the Commission accepted the companies' estimate of reproduction cost new for purposes of its interim order, it seems clear from the record that that estimate is excessive. The very fact that the reproduction cost depreciated exceeds the actual cost new casts great doubt upon the reproduction figures since the property was constructed in 1930 and 1931; most of the contracts must therefore have been let in 1930 or before, a high price period. The estimate of $13,334,775 for the present market value of the leaseholds (Exs. 131, 146, R. 2949, 3069) appears plainly excessive when it is compared with the actual cost of those leases appearing in defendants' books as of December 31, 1938; the book figure for the then existing leases is $9,367,364 (Ex. 137, R. 2993) and it is subject to substantial reduction for depletion, the companies themselves having accrued a depletion reserve of $1,152,854 (Ex. 137, R. 2991).

These items total $74,420,424, which sum the Commission adopted as the rate base (R. 3937, 3944). The companies' own recorded book cost of the properties plus working capital, in existence as of December 31, 1939, was $60,952,279 (R. 3937).

The companies urged, on the other hand, a rate base of $82,291,553, computed as follows (R. 3935):

Reproduction Cost New exclusive of Gas Reserves	$56, 302, 250
Less "Viewed" Depreciation	2, 866, 758
Present Value of Physical Properties exclusive of Gas Reserves	53, 435, 492
Present Value of Gas Reserves	13, 334, 775
Allowance for Future Capital Expenditures	6, 046, 286
Going Value	8, 500, 000
Working Capital	975, 000
Total	82, 291, 553

The Commission refused to include in the rate base the companies' claim of $8,500,000 as a separate allowance for "going concern" value and $2,237,887 for average future capital expenditures from 1943 to 1954, the date claimed by the companies for the exhaustion of their gas reserves and the termination of their business. The claim for "going concern" value was characterized by the Commission as "arbitrary" and a "deceptive fiction"; it stated in its opinion that it was convinced that it was allowing in the rate base "more than an adequate amount to cover all elements of value," and that the rate base allowed was "liberal" (R. 3936–3937). The claim for future capital expenditures from 1943 to 1954 was not included because "it is clear * * * that such improvements are not used and useful in the present and to a certain extent must be deemed conjectural" (R. 3936).

The Commission fixed 6½% as the fair rate of return on the above-mentioned rate base (R. 3938–3940).

The Commission accepted the companies' own estimate of 23 years (1932–1954) as the life of their business, and their figures, $78,284,009, for total past and future investment, less salvage (R. 3938; see Ex. 140, R. 3021).[5] From this it calculated that "the annual amortization expense on an investment of $78,284,009 for a period of 23 years, at the 6½ percent sinking fund rate, is $1,557,852. We allow that amount" (R. 3938).[6]

The Commission also accepted for the purpose of the present order the companies' statement of income available for amortization and return for 1939 to 1942, inclusive (R. 3938), the average income for such years being $9,511,454 (Ex. 140, R. 3023). The Commission noted, however, the in-

---

[5] This figure is computed as follows:

Book cost of existing properties at December 31, 1938 (R. 2991)	$59, 197, 843
Retirements actually made (1932–1938) (R. 2991, 3021)	7, 000, 918
Future capital additions, replacements, and contingencies (1939–1954) (R. 3021)	12, 159, 380
Working capital (R. 3021)	975, 000
Total	79, 333, 141
Less salvage (R. 3021)	1, 049, 132
	78, 284, 009

[6] The term amortization was used to mean an allowance for depreciation and depletion (R. 3937).

crease in federal income taxes provided by the Revenue Act of 1940, and estimated that the income available for amortization and return would be decreased to $9,362,032 (R. 3938). The Commission then concluded that the fair return, $4,837,328 (6½% of $74,420,424), exceeded the companies' estimate of return less the allowed amortization allowance ($9,362,032 less $1,557,852) by $2,966,852, which sum was available for reduction in net revenues. Because of the consequent reduction of $783,909 in federal income taxes, the order reduced the rates by $3,750,000 (R. 3941).

The Commission felt that the reduction was "conservative in view of the acceptance of the companies' estimates and the generous allowances" (R. 3941), and noted that the acceptance of reproduction cost testimony for the purpose of the order would not prevent the Commission from subsequently exercising its judgment "as to how reproduction cost evidence shall be ultimately treated * * *" (R. 3941).

E. ACTION OF THE COURT BELOW

Pursuant to Section 19 (b) of the Act, the companies petitioned the Circuit Court of Appeals for the Seventh Circuit for a review of the Commission's order (R. 3997–4009). The Circuit Court of Appeals upheld (1) the validity of the Natural Gas Act, (2) the authority of the Commission to issue an interim order reducing rates, (3) the propriety of setting 6½% as the fair rate of return, and (4) the propriety of requiring the companies to file new rate schedules reflecting the amount of the reduction ordered. The court below vacated the Commission's order, however, on the sole grounds (1) that a separate allowance for "going-concern value" of $8,500,000 should have been included in the rate base, and (2) that the period of amortization chosen should not have been the entire life of the business, but rather either the period beginning with the passage of the Act or the period commencing with the date of the rate reduction order. The court made no finding that the reduction would result in unjust, unreasonable, or confiscatory rates.[7]

F. CONTENTIONS OF THE PARTIES

The Federal Power Commission and the Illinois Commerce Commission, petitioners in No. 265, challenge the holding of the court below that a separate allowance for "going concern" value should have been included in the rate base and that the period of amortization should not have been spread over the entire life of the business. The companies, petitioners in No. 268, challenge the constitutionality of the Natural Gas Act, and in addition assert that under Section 5 (a) of the Act, the Commission must actually set rates and not merely limit profits, that the finding that the companies' present rates are unreasonable is not supported by substantial evidence, that the finding that 6½% per annum is a fair return is not supported by substantial evidence, that the Commission erred in computing the amortization allowance on the same rate of interest as allowed as a fair return, that the Commission had no authority to enter the "interim" order, that the order operates to confiscate the companies' property in violation of the due process clause of the Constitution, and that the companies did not have a fair hearing within the meaning of the Natural Gas Act.

---

[7] The court found it unnecessary to consider two other grounds of attack urged by the companies: (1) that capital additions from 1943 to 1954 should have been included in the rate base, and (2) that 2% instead of 6½% interest should have been used in calculating the amortization allowance.

SPECIFICATION OF ERRORS TO BE URGED IN NO. 265

The court below erred:

1. In holding that the Federal Power Commission was required to include in the rate base a separate allowance for going concern value.

2. In holding that, in computing the amortization allowance, the Commission should have taken as the period of amortization either the period beginning with the passage of the Natural Gas Act or the period beginning with the date of the rate order.

3. ~~In vacating and setting aside the Commission's~~ order.

SUMMARY OF ARGUMENT

I

The Natural Gas Act of 1938 is a valid regulation of interstate commerce as applied to these companies.

II

The procedure adopted by the Commission in entering an interim order directing the companies to file a new schedule of rates reflecting a $3,750,000 reduction in annual earnings was authorized by the Act. The companies had a full hearing on every aspect of the case, including both the jurisdictional and substantive issues, and the statutory requirement that an order be entered "after a hearing" was consequently satisfied.

The fact that the Commission did not itself fix a detailed rate schedule does not render its order invalid. The practice followed by the Commission in this case is a familiar one in rate regulation. It is impliedly authorized by Section 5 of the Act, which empowers the Commission to fix reasonable rates, and expressly authorized by Section 16, which empowers the Commission to issue "such orders as it may find necessary or appropriate to carry out the provisions of this Act."

III

On the merits of the Commission's order, two issues are before the Court. The first is whether the rates prescribed are confiscatory. The second is whether the Commission exceeded its statutory power to determine "reasonable rates" upon finding that the existing rates are "unreasonable." In principle the constitutional and statutory questions are separate and distinct, for the legislature may command the use of one method of rate making whereas the Fifth Amendment may permit use of a different test in determining whether the prescribed rates are confiscatory. In deciding the constitutional issue, it is not material that the Commission did in fact adopt the present fair value test. The Court must determine for itself whether the Constitution protects the present fair value of the property or only the investment in the property and then must test the validity of the Commission's order in the light of the proper constitutional principle.

IV

The reduction in rates ordered by the Commission does not violate the companies' constitutional rights. The Commission properly refused to make a separate allowance in the rate base for "going concern" value, properly computed the amortization allowance, and fixed a generous rate of return.

A. The claim for going concern value is, on precedent, plainly untenable. It is settled by the decisions of this Court that a separate allowance need not be made where the physical assets have been appraised "as part of an assembled whole" and that a valuation based on reproduction cost includes a sufficient allowance for going concern value notwithstanding that the reproduction cost estimate is exclusively attributable to physical assets. The rationale of the decisions is that, when a valuation is made on a reproduction cost basis, the result in itself reflects a going concern, for if properties were not actually a going concern they would have only a scrap value, much less than reproduction cost less depreciation. Moreover, this Court has specifically condemned the particular method of calculating going concern value adopted by the companies in this case. *Galveston Elec. Co.* v. *Galveston,* 258 U. S. 388.

On principle, the inclusion in the rate base of an allowance for going concern value is not required by the Constitution under any permissible theory of rate regulation.

B. The Commission made a proper allowance for amortization.

1. The Commission properly based its depreciation allowance on the cost rather than the fair value of the properties. This is entirely clear if, as we urge, the Constitution protects only the investment and not the fair value of the property. It is equally clear even if *Smyth* v. *Ames,* 169 U. S. 466, enunciates the applicable constitutional principle.

It is almost universal business practice to base the depreciation charge on cost in the computation of net earnings. The net earnings, so computed, of unregulated enterprises and the yield upon their securities, which in turn is based upon such net earnings, form the basis upon which the rate of return allowed to a utility is determined. To base the annual depreciation allowance upon fair value in the case of a utility would result in an additional profit over and above a fair return.

2. The Commission also properly fixed the depreciation period as the entire life of the property. Depreciation is simply an operating expense representing the annual diminution of the service capacity of the property. Manifestly, some of the service capacity of the property was consumed in the eight and a half years which elapsed prior to the entry of the order.

Under the sinking fund method used by the Commission, the amount of depreciation, measured in terms of original cost, attributable to the period prior to the date of the rate order is less than the actual accrued depreciation and is less than the amount which, under proper accounting practice, the companies should have charged and in fact did charge for depreciation during this period. Therefore, whether the Constitution is deemed to protect the property or the investment, the Commission's action in this respect was valid.

3. The Commission properly concluded that the rate of interest to be used in computing the annual amount necessary to amortize the total in-

vestment should be the same as the rate of return. This is so because, under the sinking fund method, by allowing a 6½% return on the full rate base without any deduction for amortization, the Commission in effect allowed a 6½% return on both the unamortized portion of the rate base and on the amortization reserve. The use of a 2% interest rate in computing the amortization allowance, as the companies urge, would result in an excessive return to the companies because, in applying the rate of return to the undepreciated rate base as provided by the sinking fund method, the 6½% interest rate thus in effect applied to the amortization reserve is 4½% higher than the 2% rate of interest used in computing the amortization allowance.

C. The record amply supports the Commission's finding that 6½% is a fair rate of return.

V

The Commission's findings that the companies' existing rates are unreasonable and that the level of rates fixed by the Commission is reasonable are supported by substantial evidence. The companies' contention to the contrary proceeds on the assumption that the reasonableness of rates must be determined by the value and benefit of the service rendered, and that the fact that the existing rates yield millions in excess of a fair return on the value of the property is not sufficient evidence to support a finding of unreasonableness. The contention is obviously without merit. The reasonableness of the rates must be measured either by a fair return on fair value or by a fair return on investment, and not by the value of the service to the consumer. And there can be no doubt that, under either the investment or fair value test, the rates charged by the companies were "unreasonable" and that the rates fixed by the Commission are "reasonable" in the statutory sense.

VI

The rule of *Smyth* v. *Ames,* 169 U. S. 466, which requires a fair return on the fair value of the property, is unsound and the case should now be overruled. The rule is based on the eminent domain principle of "just compensation" for a "taking" of property. The regulation of rates, however, is not a "taking" of property; it is simply the exercise of the legislative power to fix prices in the public interest. The sole question of validity, therefore, as in any other case of price regulation, is whether the regulation is reasonable.

The regulation of rates on the investment basis is clearly reasonable, although regulatory agencies may be free to adopt other methods warranted by business practice. On the basis of long experience, almost all informed opinion is agreed that effective rate regulation on a fair value basis is a practical impossibility, and that the investment standard is sound and workable, is just to the utilities and will attract sufficient capital to secure adequate service.

ARGUMENT

I

THE NATURAL GAS ACT OF 1938 IS A VALID REGULATION OF INTERSTATE COMMERCE

The court below concluded "without much doubt" that the Natural Gas Act is constitutional (R. 4030). Its conclusion is plainly correct.

The sale, transportation, and delivery of natural gas from one state to distributors in any other state constitutes interstate comerce subject to regulation by Congress. *State Commission* v. *Wichita Gas Co.*, 290 U. S. 561, 563; *Public Utility Commission* v. *Attleboro Co.*, 273 U. S. 83, 90; *Peoples Gas Co.* v. *Public Service Commission*, 270 U. S. 550, 554; *Missouri* v. *Kansas Gas Co.*, 265 U. S. 298, 303. Admittedly the companies are engaged in that business.

The fixing of rates charged by the companies does not contravene the Fifth Amendment. In the field of interstate commerce, Congress may provide for administrative regulation of rates and charges without regard as to whether the business regulated is a "public utility," provided that the fixing of rates bears a reasonable relation to a proper legislative purpose. ***Sunshine Anthracite Coal Co.*** v. ***Adkins***, 310 U. S. 381, 393–397. See also ***Olsen*** v. ***Nebraska***, 313 U. S. 236; ***United States*** v. ***Darby***, 312 U. S. 100; ***United States*** v. ***Rock***

Royal Cooperative, 307 U. S. 533, 569; *Nebbia* v. *New York,* 291 U. S. 502. To protect the public against unreasonable charges for gas, light, and heat has traditionally been an appropriate legislative purpose. And regulation of the rates charged to the local distributor by gas pipeline companies is plainly a reasonable if not an essential step toward that end. Indeed, the extensive character of the investigation on which Congress based its findings that regulation of the business of transporting and selling natural gas for ultimate distribution to the public "is necessary in the public interest," is sufficient to rebut any charge of arbitrary and capricious action.

The question whether Section 7 of the Act is unconstitutional because it prohibits a company from withdrawing from the business is not before this Court. Quite apart from Section 7, the Act sets up a separable and workable system of rate regulation. The order appealed from fixes only rates. The companies have filed no application with the Commission for leave to withdraw from business and therefore cannot complain of any injury from this provision of the Act. Since the Act contains a separability clause in Section 23 and would be workable without Section 7, the Court need not now consider the constitutionality of Section 7. *Electric Bond & Share Company* v. *Securities & Exchange Commission,* 303 U. S. 419, 439.

In any event there can be little doubt that Section 7 is constitutional. Continued operation by gas pipeline companies which are chief suppliers to local distributing utilities may often be necessary to the public convenience, for an essential supplier of a distributing utility stands in this respect in the same position *vis a vis* the public as the distributor itself. Consequently it is a reasonable regulation, except in cases of confiscation, to require such a corporation to show before it ceases operations that discontinuance of the service will not injure the public which the corporation has brought to rely upon it. Cf. *United Gas Co.* v. *Railroad Commission*, 278 U. S. 300, 308-309. To the extent that *Wolff* v. *Court of Industrial Relations*, 262 U. S. 522, has not been overruled by later decisions it is not persuasive here, for, as the Court pointed out in that case, different regulations are appropriate for different businesses. See 262 U. S. at 539.

II

THE NATURAL GAS ACT AUTHORIZED THE COMMISSION, AFTER GRANTING A FULL HEARING TO THE COMPANIES, TO ENTER AN INTERIM ORDER DIRECTING THE COMPANIES TO FILE A NEW SCHEDULE OF RATES REFLECTING A PRESCRIBED REDUCTION IN OPERATING REVENUES

The companies contend that, under the terms of the Act, the Federal Power Commission had no authority to enter the type of order here under review. First, they say that the Commission may enter a rate order only after the hearing is completed—in other words, that it lacks authority to enter an "interim" order. Second, they say that the order is invalid because the Commission did not fix just and reasonable rates in accordance with the Act but merely ordered the companies to file a new schedule of rates reflecting a prescribed reduction in operating revenues. We submit that both the Commission and the court correctly rejected these contentions.

A. The Commission acted properly in entering an interim order on the companies' evidence

Section 5 (a) of the Act provides that "Whenever the Commission, after a hearing * * * shall find that any rate * * * is unjust, unreasonable, unduly discriminatory or preferential, the Commission shall determine the just and reasonable rate * * * and shall fix the same by order". The only limitation upon the kinds of rate order which the Commission is authorized to issue is that the order must be made after "a hearing." That statutory requirement was met in the instant case. The companies had every opportunity to present all their evidence on both the jurisdictional and substantive aspects of the problem (R. 3931), cross-examined every witness for both the Federal Power Commission and the Illinois Commerce Commission (R. 3932), offered what rebuttal testimony they desired (R. 3932) and before the so-called interim order was entered stated that they had concluded their case (R. 4004). They filed briefs and argued orally. In short there was a full hearing in every substantial sense. As the Commission very properly observed, defendants "cannot be heard to complain that they have not yet been able to examine on redirect their own witnesses who have not yet been cross-examined, nor is it essential to a full hearing on the motion before us that they be permitted to cross-examine or rebut witnesses who have not yet been offered by counsel for the commissions" (R. 3932).

It seems plain that the hearing required by Section 5 (a) is a hearing in this substantial sense and not the technically completed proceeding to which the companies refer. The purpose of the requirement is simply to ensure that the Commission will act upon evidence and give the utility an opportunity to know, and to meet if it can, the claims, and evidence in support of them, upon which any order will be based. Accordingly, this Court in applying the Transportation Act of 1920 held (*New England Divisions Case,* 261 U. S. 184, 201):

> A hearing may be a full one, although the evidence introduced does not enable the tribunal to dispose of the issues completely or permanently; and although the tribunal is convinced when entering the order thereon, that, upon further investigation, some changes in it will have to be made.

To read the Natural Gas Act in the same manner carries out its purpose that rates shall always be reasonable. It enables the Commission, as it did in the instant case, to hear the utility in full and then make findings and lower the rates to a level which appears reasonable on the evidence most favorable to the utility, such rates to be effective while the Commission continues the hearing to determine whether the rates should be still further reduced. On the other hand, the construction urged by the companies would serve no substantial purpose for the Commission could legitimately achieve the same result by the cumbersome process of opening and closing a succession of hearings.

Moreover, Congress evidently intended the Commission to have this salutory power to enter a rate order without regard to the technical distinctions between an interim order after a full hearing in a pending proceeding and a final order after a proceeding is closed, for in Section 16 it provided, "The Commission shall have power to * * * issue * * * such orders * * * as it may find necessary or appropriate to carry out the provisions of this Act."

The failure to include in the Act power to enter orders fixing temporary rates, after the analogy of the New York and Pennsylvania statutes,[8] is no indication of a contrary intention; there is a vast distinction between fixing rates on the basis of the utility's own case at a time when the hearing could be closed and prescribing a rate on the basis of the utility's original cost less reserve before the utility has had full opportunity to present all its evidence. In this case the Commission has not fixed nor sought to defend the level of rates prescribed by the interim order on any basis that would not be equally applicable to a final order. Cf. *Driscoll* v. *Edison Company,* 307 U. S. 104. The Commission has considered all evidence relevant on any theory of rate making and the validity of its order on the merits is to be tested by the same principles which would govern the validity of any final rate order.

---

[8] See *Driscoll* v. *Edison Co.*, 307 U. S. 104; *Matter of Bronx Gas & Electric Co.* v. *Maltbie*, 271 N. Y. 364.

B. The Commission acted properly in directing the companies to file a new schedule of rates reflecting a prescribed reduction in operating revenues

The companies' contention that the order is invalid because it does not fix a schedule of rates ignores the twofold character of rate regulations. One branch is to determine the general rate level; the other is to cure maladjustments, discriminations, and unfairnesses in the details of the schedule. The two may properly be separated and either dealt with alone in such a way as to meet the essential problem before the regulatory body. Particularly that has been true where, as in the instant case, the hearings reveal that a blanket change is needed as well perhaps as detailed adjustments; the former has not been made to wait on the latter.

The Interstate Commerce Commission has long recognized the difference and framed its orders to the general rate structure or the particular tariff according to the problem before it. *New England Divisions Case*, No. 646, October Term 1922, Brief for Interstate Commerce Commission, pp. 65, 67–76. And this Court has held that the Interstate Commerce Commission has power in fixing rates and divisions to deal with the major over-all controversy and leave the detailed schedules for the carriers to develop in the first instance. *New England Divisions Case*, 261 U. S. 184, 201–202.

Similarly, it is an accepted practice for state commissions to order utilities to make such a reduction in rates as will reflect a prescribed decrease in operating revenues. *E. g., Driscoll* v. *Edison Co.*, 307 U. S. 104, 107.

Under the Natural Gas Act the Commission likewise has power to mould and limit its order to meet the needs of the real controversy. Section 5 is modeled after the provisions of the Interstate Commerce Act and Transportation Act of 1920 which had been interpreted to give the Interstate Commerce Commission that power. Moreover, Section 16 provides that the Commission may issue any order which it finds necessary or appropriate to carry out the provisions of the Act. In the present case the real controversy was over the general rate level and not any particular rate, and the hearings had revealed a rate structure far higher than the reasonable levels prescribed by

Section 4. Consequently, it was appropriate to meet that problem by ordering a general reduction without delaying to hear evidence and make a final order upon the details of a precise schedule with which no one was then concerned. Indeed, the companies can scarcely be heard to complain because they were given the right to present for Commission approval the precise rates and charges. As the court below pointed out, such treatment is "more favorable" to them than the promulgation of an entire schedule (R. 4032).

III

THE ISSUES BEFORE THIS COURT ON THE MERITS

Section 19 (b) of the Act provides:

> (b) Any party * * * aggrieved by an order issued by the Commission * * * may obtain a review of such order in the circuit court of appeals * * * by filing * * * a written petition praying that the order of the Commission be modified or set aside in whole or in part. * * * The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. * * * The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court * * *.

The present proceedings were instituted pursuant to this section.

Two issues on the merits are before the Court. The first is whether the rates prescribed by the Commission are confiscatory in nature, i. e., whether the due process clause of the Constitution has been violated. The second is whether the rates prescribed by the Commission are beyond its statutory power to determine "reasonable rates" upon a finding that the existing rates are "unreasonable" or are "not the lowest reasonable rates" (Sec. 5 (a)).

In so far as the Congress has adopted the measure of constitutional validity as the basis for determining statutory reasonableness, the answer to both questions may turn on the same considerations of fact. In principle, however, the statutory and constitutional questions are separate and distinct and the distinction has an important effect on the scope of judicial review in this case.

The legislative methods which may be prescribed by Congress for rate making are not necessarily the same as the constitutional principles by which the validity of the legislative methods or the rates ordered pursuant thereto must be tested. The scope of statutory authority must be measured by the command of the legislature; the test of constitutionality is drawn from the Constitution. The distinction between statutory and constitutional requirements, obvious enough in most cases where questions of both statutory authority and constitutional validity are involved, would be clear in a rate case if the prescribed legislative method were based on the prudent investment principle and the test of constitutionality drawn from the Fifth Amendment were fair value. In such a case it would not seriously be suggested that the Court was bound to apply the prudent investment principle as the test of constitutional validity of rates merely because the legislature had adopted this standard as the basis of statutory authority, although the legislative action would be persuasive of its reasonableness where the test of validity drawn from the Constitution is reasonableness.

This Court recognized the distinction in *Los Angeles Gas Co.* v. *Railroad Commission,* 289 U. S. 287, 304–305, where the Court rejected a contention that an order of a state utility commission, based in substance on the prudent investment principle, was invalid because of the method employed by the commission. The Court, speaking through Chief Justice Hughes, declared:

> * * * We do not sit as a board of revision, but to enforce constitutional rights. *San Diego Land & Town Co.* v. *Jasper,* 189 U. S. 439, 446. The legislative discretion implied in the rate making power necessarily extends to the entire legislative process, embracing the method used in reaching the legislative determination as well as that determination itself. We are not concerned with either, so long as constitutional limitations are not transgressed. When the legislative method is disclosed, it may have a definite bearing upon the validity of the result

> reached, but the judicial function does not go beyond the decision of the constitutional question. That question is whether the rates as fixed are confiscatory. And upon that question the complainant has the burden of proof and the Court may not interfere with the exercise of the State's authority unless confiscation is clearly established.

The conclusion is the same where the legislative method prescribed or authorized by the statute is fair value. The Court is obviously not bound to apply the statutory standard as the measure of constitutional validity. The distinction has been lost sight of largely because the utility commissions have adopted the rule of *Smyth* v. *Ames* as the legislative method of rate making, with the result that the administrative and constitutional inquiries have been the identical one of determining the present fair value of the utility. As Mr. Justice Brandeis observed in his concurring opinion in ***Southwestern Bell Tel. Co.* v. *Public Service Commission*, 262 U. S. 276, 289, 296:**

> The rule there stated [in *Smyth* v. *Ames*] was to be applied solely as a means of determining whether rates already prescribed by the legislature were confiscatory. It was to be applied judicially after the rate had been made; and by a court which had had no part in making the rate. When applied under such circumstances the rule, although cumbersome, may occasionally be effective in destroying an obstruction to justice, as the action of a court is, when it sets aside

> the verdict of a jury. But the commissions undertook to make the rule their standard for constructive action. They used it as a guide for making, or approving, rates. And the tendency developed to fix as reasonable, the rate which is not so low as to be confiscatory. * * *

The action of the Commission in this case in adopting fair value as the rate base and original investment as the amount to be amortized, thus presents two questions: First, whether the Commission was authorized by the statute to fix reasonable rates on this basis; and second, whether the Constitution condemns the legislative method or result. We show below that the Commission's action was authorized by the Act. See *infra*, pp. 106-112. We also show below that, even if the measure of constitutional validity is that announced in *Smyth* v. *Ames*, the companies have not been denied any constitutional rights. For the reasons set forth above, however, the Court is at liberty to determine whether the standard of validity to be drawn from the Constitution is that of prudent investment. To be sure, if the present fair value standard, adopted by the Commission pursuant to statutory authority, were itself challenged as unconstitutional, the legislative adoption might be of significance in determining constitutional reasonableness. But where, as here, the challenge is that this standard was not faithfully applied, this Court may reject the challenge if the Constitution protects only the investment and if the rates, as we show below, are in excess of what the Constitution, as thus construed, requires.

We proceed, then, to a discusssion of the issues on the merits. We propose to show in that discussion that the rates were reasonable in a statutory sense and that they were not confiscatory in a constitutional sense. Since judicial consideration of the questions of going concern value and amortization have normally been presented to the courts in constitutional cases, we discuss the constitutional issue first. The principles discussed in the portion of the brief devoted to the constitutional issue, however, are very largely applicable to the question of the reasonableness of the rates in the statutory sense.

IV

THE REDUCTION IN RATES ORDERED BY THE COMMISSION DOES NOT VIOLATE THE COMPANIES' CONSTITUTIONAL RIGHTS

The companies urge that the Commission erred in failing to make a separate allowance for "going concern" value, in the computation of the amortization allowance, and in fixing the rate of return at 6½%. We propose to show that the Commission's action with respect to each of these items was correct and accordingly that the claim of violation of the companies' constitutional rights—as well as the claim that the reduced rates ordered are not "reasonable" within the meaning of the statute—is without substance.

In this section of the brief, we discuss the companies' contentions on the assumption that the Constitution requires a fair return on "present fair value." In a subsequent section of the brief, however, we urge that this Court should now declare that the only requirement imposed by the Constitution is that a fair return be allowed upon net investment.[9]

We emphasize now this argument which we make later in the brief for the reason that much of the confusion in the cases with respect to going concern value and amortization is attributable to a failure by the courts to comprehend that the treatment to be accorded these items depends, in part at least, upon whether the "present fair value" or "investment" test is used. For purposes of clarity, therefore, we not only show in this section of the brief that the Commission's treatment of going concern value and amortization was correct under the "present fair value" rule, but also point out the relation of the issues discussed to the "investment" test.

---

[9] For purposes of this brief the following definitions will be adopted:

"Investment"—the amount reasonably and honestly invested by the present owner in the public utility properties used and useful in the public service.

"Original cost"—the actual legitimate cost of the property to the company first devoting it to the public service. In this case, "investment" and "original cost" are the same.

"Net investment"—gross investment subject to reduction for the proper amount of depreciation.

"Net original cost"—the original cost less related depreciation, amortization, and depletion reserves.

"Reproduction cost"—the estimated cost of reproducing the existing property of the utility which is used and useful in rendering public service.

A. THE COMMISSION PROPERLY REFUSED TO MAKE A SEPARATE ALLOWANCE FOR GOING CONCERN VALUE

1. The facts with respect to the companies' claim for a separate allowance for going concern value

The Commission adopted the companies' estimate of reproduction cost in fixing the rate base (R. 3937), but refused to make a separate allowance of $8,500,000 claimed by the companies as "going value." In doing so the Commission declared that the rate base was "liberal" and that it had allowed "more than an adequate amount to cover all elements of value" (R. 3936–3937). The companies contend that their estimate of reproduction cost was based solely on the cost of replacing the physical elements and excluded any element of intangible value, and that, according to the uncontradicted testimony of the companies' witnesses, the property had an additional intangible or "going value" of $8,500,000. They urge that the Commission erred both in that it failed to consider "going value" at all and in that it failed to find this value in the amount of $8,500,000 (Br. pp. 68, 101). While they purport to disavow any contention that the physical and intangible values must be separately appraised (Br. p. 68), their claim for an allowance additional to that which they claim for the physical properties obviously comes to the same thing.

The rate base adopted by the Commission included, in addition to labor and material costs, large amounts for overhead, interest, taxes, administrative, legal and supervisory charges, and expenses of preliminary operations (R. 1221–1234). The companies claim, in addition, the right to capitalize costs allegedly incurred during the early period of operations until the development of subsequent capacity. Specifically, these costs are alleged to consist of advertising and promotional expenditures, interest allocated to a portion of the capacity not completely used prior to development of full capacity, taxes allocated to such facilities, depreciation allocated to such facilities, and operating expenses and maintenance costs on the facilities (Br. p. 55). These costs are claimed to be "actual" costs notwithstanding that the facilities were in actual use during the period, although not used to full capacity. The claim is not limited to the two-year period when the companies allegedly were operating at a loss (Ex. 136, p. 1, R. 2959), but embraces all four years, 1932 to 1935, inclusive, during which operations failed to reach the so-called normal operating level of the 1936–1938 period, when the companies operated at a rate which equalled so far as practicable the maximum operating capacity of the physical properties. (R. 1330, 1278.)[10] On this method of calculating going concern value, as the companies' witness Emery frankly conceded (R. 1951), the going value would have been correspondingly increased if operating charges had been greater because of inefficiency. Similarly, Emery testified that if bond interest or taxes had been larger, going value would presently be greater (R. 1957). So, too, he admitted that if existing depreciation be greater than that testified to by the companies' witness on "observed depreciation," going value would be greater (R. 1958).

---

[10] The companies' witness, Hamilton (R. 1276–1282), took the average revenues for the fifth, sixth, and seventh years of operation (1936–1938), during which the companies operated at about 92 per cent of theoretically maximum capacity. This figure, $14,847,112, he reduced to $12,372,593 because of increased capacity after 1936. He then ascertained the revenues for 1932, 1933, 1934, and 1935 (the years in which the business was being attached) and divided each year's revenue by the average revenues of $12,372,593 and arrived at the percentage of actual revenue to capacity revenue for those years, and by deducting each percentage from 100 per cent he arrived at the nonproductive capacity of the plant for those years—52.7% for 1932, 49.5% for 1933, 23.3% for 1934, and 2.7% for 1935. He then applied these percentages to interest paid on money, taxes paid, depreciation expense, and operating expense and found $6,664,192 as the expense supposed to be attributable to nonproductive capacity, to which he added $1,567,372, the total actual cost of advertising and similar direct expenditures for attaching business during the years 1932–1935, and arrived at the figure of approximately $8,500,000 for "going value." Emery's method was similar (R. 1327–1337). He likewise took the years 1936, 1937, and 1938, as the time during which the companies were operating substantially at maximum capacity and found that the "lag in attaching business" (R. 1330) was 51.98% in 1932, 56.75% in 1933, 21.42% in 1934, and 3.63% in 1935. Applying these percentages to the interest expense, general expense, and depreciation expense and adding "cost of attaching business" he arrived at practically the same result as Hamilton.

The companies' claim for an $8,500,000 allowance for development costs as part of present fair value seems patently absurd in the light of the record in this case, which shows that there was never any real risk that early deficits in earnings due to development costs would not be amortized out of subsequent earnings or any real potential difficulty in creating a sufficient consumer demand within a short period. The original investors in the enterprise included the owners of three large gas distribution systems in and about Chicago (R. 2088) and before operations began the companies secured a 15-year contract, renewable for five years at their option, with the Chicago District Pipeline Company, under which the latter purchases 90% of the companies' gas and resells it to the three distributing companies in the Chicago area (R. 585, 2088, 2063). These distributing companies, which furnish the gas requirements of the Chicago area, one of the richest and most populous in the country, had a substantial investment in the companies in this case (R. 2088), and guaranteed the contract with Chicago District Pipeline Company (R. 3).

The companies themselves regarded the risk of early deficits as negligible. Thus, the original estimates which they submitted to the Illinois Commerce Commission in 1931 (Ex. 156, R. 3334) before they began operations, in justifying the reasonableness of their charges to the distributing companies, disclosed an expected average return of only 6.3%, and this on the assumption that their gas reserves would be exhausted in 15 years. That the companies considered this expected average rate of return, which they now contend is insufficient even for a going concern, sufficient to warrant a large investment in a new enterprise, is clear proof that they discounted any risk that early development expenses could not be quickly paid out of subsequent earnings without capitalization for the total life of the enterprise.

The return earned by the companies has in fact far exceeded their expectations, and the development costs have already been many times recouped. During the years 1936 to 1938, the period of full operation, the companies made enough to pay all operating, maintenance and general expenses, provide for depletion, depreciation and retirements, and to earn in addition 11.9 percent on their gross investment."[11] The various items claimed as going value have already been charged to operating expenses and in fact paid for by the consumers (Ex. 136, p. 1, R. 2959; Ex. 136, p. 2, R. 2961). Even if the entire sum of $8,500,000 claimed as "going value" be deducted from the net earnings available for return in the three years from 1936 through 1938, the companies would still have earned an average of 7.28% on the undepreciated investment during the years 1936 to 1938. See footnote 11, below. During the period 1932 to 1938, inclusive, the average annual return was 8.1% on the undepreciated investment and 8.8% on the approximate

---

[11] This is shown by the following table:

	1936	1937	1938
Capital Assets (Ex. 137, R. 2991)	$59, 529, 748. 76	$59, 436, 823. 31	$59, 197, 842. 69
Working Capital (Ex. 141, R. 3025)	975, 000. 00	975, 000. 00	975, 000. 00
Total	60, 504, 748. 76	60, 431, 823. 31	60, 172, 842. 69
Net Earnings Before Other Charges (Ex. 136, R. 2959)	10, 343, 134. 88	10, 796, 261. 76	9, 910, 662. 19
Depreciation, Depletion, and Retirements (Ex. 136, R. 2959)	3, 207, 293. 21	2, 293, 109. 79	3, 232, 633. 63
Net Earnings Available for Return	7, 135, 841. 67	7, 864, 151. 97	6, 678, 628. 56
Total Undepreciated Cost of Property, plus Working Capital (1936, 1937, 1938)			181, 109, 414. 72
Total Net Earnings Available for Return (1936, 1937, 1938)			21, 678, 022. 20
Average Return on Undepreciated Rate Base (percent)			11. 9
Net Earnings Available for Return less $8,500,000 claimed by the Companies for Going Value			13, 178, 022. 20
Average Return on Undepreciated Rate Base after Deducting from Return the Total Amount Claimed for Going Value (percent)			7. 28

average depreciated investment,[12] much greater than expectations. The return of 6.5% now allowed to the companies as an established enterprise exceeds that contemplated by the companies prior to the commencement of the business. To permit capitalization of these alleged charges already recouped would be to permit an inordinate return.[13]

2. *The controlling decisions of this Court support the Commission's denial of the companies' claim*

On precedent, the companies' claim for a separate allowance for going concern value is plainly untenable. This Court has held that "going value" must be considered by the rate-making agency "upon proof of its existence". *Dayton P. & L. Co.* v. *Public Utilities Commission,* 292 U. S. 290, 308; *Los Angeles Gas Co.* v. *Railroad Commission,* 289 U. S. 287, 314. It is now settled, however, that a separate or additional allowance for such value is not required where the physical assets have been appraised "as part of an assembled whole." *Columbus Gas & Fuel Co.* v. *Public Utilities Commission,* 292 U. S. 398, 411; *Dayton P. & L. Co.* v. *Public Utilities Commission,* 292 U. S. 290, 309; *Denver Stock Yard Co.* v. *United States,* 304 U. S. 470, 478–480; cf. *Des Moines Gas Co.* v. *Des Moines,* 238 U. S. 153, 171. Accordingly, a valuation based on reproduction cost includes a sufficient allowance for intangible going value even though the estimate of replacement cost is "exclusively attributable to physical elements." *Denver Stock Yard Co.* v. *United States,* 304 U. S. 470, 479; *Dayton P. & L. Co.* v. *Public Utilities Commission,* 292 U. S. 290, 309; cf. *Des Moines Gas Co.* v. *Des Moines,* 238 U. S. 153, 171; *Columbus Gas & Fuel Co.* v. *Public Utilities Commission,* 292 U. S. 398, 411; *Driscoll* v. *Edison Co.,* 307 U. S. 104, 117.[11]

---

[12] As appears from Exhibit 136, p. 1 (R. 2959) the companies' total earnings in the seven years 1932 to 1938, inclusive, amounted to $8,244,435.79 net profit, to which must be added $23,994,029.98, interest on bonds, and $1,802,416.57, bond discount. Taking $60,000,000 as approximate average investment, the average annual earnings were 8.1% prior to regulation, an amount sufficient to amortize any possible loss during the first three "developmental" years. The return on the approximate average depreciated investment was 8.8% (see p. 11, *supra*).

[13] Even the companies themselves admit (Br. 163) that their average annual earnings for the first seven years of operations (1932–1938) were $1,234,118.88 per year above the amount allowed by the Commission. This is a total of $8,639,316.00, or more than the amount claimed for going value. This does not take into account similar or greater excess earnings from the end of 1938 to the date of the Commission order in July 1940. See Ex. 187, R. 3784, showing increase in net earnings of the companies of $790,318.00 for the 8 months ended August 31, 1939, as against the same period in 1938, and an increase of $1,228,984.00 in net earnings available for dividends after depreciation, depletion, retirement, and fixed charges.

---

[11] The opinion of Mr. Justice Butler in *Denver Stock Yard Co.* v. *United States, supra,* suggests that an additional allowance for "going value" might be justified on a showing of an unusual ability to earn at "low rates" as compared with other like utilities (304 U. S. at 480), a suggestion which he had previously advanced in *McCardle* v. *Indianapolis Water Co.,* 272 U. S. 400, 413–415. See also his dissenting

The rationale of these decisions is that when the physical properties and the incidental rights have once been appraised both as to primary valuation and deduction for depreciation, the result in itself reflects a going concern value, for the total amount constitutes valuation from the standpoint of a successful enterprise. It presupposes attached customers, a given demand for services, and appropriate business organization and management. If the properties were not actually a going concern and were not regarded as such, their valuation would be very much less than reproduction cost less depreciation; practically, all the plant and equipment units would have only a scrap or sacrifice sale value. Plainly, therefore, the fact that the utility is a going concern is reflected in every item and every assumption contained in a reproduction cost valuation. See Bauer and Gold, *Public Utility Valuation*, pp. 306–307.

Under the decisions cited, the Commission here clearly gave due consideration to the intangible element of going concern value, because the reproduction new estimate which it used to compute the rate base was based on the cost of reproducing the

---

opinion in *Los Angeles Gas & Electric Co.* v. *Railroad Commission*, 289 U. S. 287, 324–325. Whether earning power at reasonable rates may properly be considered in a rate proceeding in which the inquiry is the reasonableness of the rates is a question considered below. See *infra*, p. 58. It is sufficient for present purposes to note that the companies make no claim for going concern value based on relative earning power.

properties as an assembled whole and because the Commission found, on all of the evidence, that the rate base allowed was "more than an adequate amount to cover all elements of value" (R. 3936–3937).

The Court should note the confusion in the companies' argument that the Commission, in adopting the companies' estimate of reproduction cost as the present value of the physical property, excluded any intangible going concern value. The argument is based on the fact that the companies' engineers referred to their reproduction cost appraisal as a "valuation" of the physical properties and stated that it did not include anything for going value. The obvious answer is that these witnesses did not determine value; they only made an estimate of the cost of reproducing the properties. The Commission and the Commission alone is the proper agency to determine the value which is to be used as the rate base. Upon a consideration of the record and for purposes of this case, the Commission took the figure represented by the companies' reproduction cost estimate as the value of the properties as an assembled whole, covering all elements of value.

The Commission was not required to give any consideration to the particular estimate of $8,500,000 going value prepared by the companies' witnesses. This estimate was based on the theory that going value is the difference between the value of the physical plant alone without customers attached and the value of a plant with the maximum number of customers attached from the outset, that this value is measured by the cost of attaching such customers, and that such cost is in turn determined by the theoretical cost of maintaining the theoretically unused capacity and personnel in addition to the out-of-pocket operating expenses for promotion, advertising, and the like already charged to operating expenses. See pp. 40–41 *supra.* The estimate, consistently with the underlying theory, includes in the cost of attaching business the charges thus attributed to unused capacity during years in which there was no deficit as well as during those in which operating deficits were allegedly incurred, presumably in the view that the utility is entitled as a matter of economic fact and constitutional right to commence operations with a full complement of maximum business instantaneously attached.

This method of calculating going value was specifically condemned by this Court in *Galveston Electric Co.* v. *Galveston,* 258 U. S. 388, 394–395. See also *Columbus Gas & Fuel Co.* v. *Public Utilities Commission,* 292 U. S. 398, 411–413; *Dayton P. & L. Co.* v. *Public Utilities Commission,* 292 U. S. 290, 309; *Los Angeles Gas Co.* v. *Railroad Commission,* 289 U. S. 287, 313. In the *Galveston* case, this Court held that a lag in earnings in the development years and due to development costs could not be capitalized and included in the rate base where the rate base was predicated on present value. This ruling was followed in the other cases cited. The method of calculation employed in this case differs from that condemned in the *Galveston* case only in that it includes as a cost of attaching business not only the charges attributed to unused capacity and the like during the period of alleged early deficits but also those incurred after the property was put on a paying basis but before the full load was developed. It seems obvious, however, that if the Constitution does not guarantee the ability to earn a fair return (*Galveston Elec. Co.* v. *Galveston, supra,* at 394–395), *a fortiori* it does not guarantee a utility the ability to reach its full unregulated earning capacity immediately.

It is true that the companies were not subject to federal regulation at the time these alleged costs were incurred and it may be assumed for purposes of argument that the Commission may not retrospectively reduce the companies' past earnings. By the same token, however, the Commission cannot be required to permit the companies to charge present customers an amount sufficient to make up for their failure to realize maximum unregulated earnings in the past, beginning with the moment of commencement of operations. Where present value is the basis of rate regulation, "Deficits in the past do not afford a legal basis for invalidating rates, otherwise compensatory, any more than past profits can be used to sustain confiscatory rates for the future." *Los Angeles Gas Co.* v. *Railroad Commission,* 289 U. S. 287, 313.

The companies contend that the cases we have cited merely hold that the allowance for development costs depends on the history of the particular enterprise (cf. *Los Angeles Gas Co.* v. *Railroad Commission, supra,* at 314) and that the costs claimed in this case, unlike those alleged in the other cases, were actually incurred and should therefore be capitalized as part of the investment. While there is language in the cases to support this distinction, the decisions may not be so narrowly construed. The deficits allegedly incurred in the *Galveston* case were no less a necessary cost of development than the charges claimed here.[15] Thus, the opinion of Mr. Justice Brandeis recognized that, if a fair return were to be calculated on the amount "prudently invested", the funds "necessarily expended at the start in overcoming initial difficulties incident to operation and in securing patronage" (258 U. S. at 394) might with "propriety" be included in the investment base; he concluded, however, that such development costs need not be considered on a present value basis since "Past losses obviously do not tend to prove present value." 258 U. S. at 395. A contrary view would lead to the absurd conclusion that "base value [should] be deemed less in law if there was no development cost, because success was instant and continuous." *Id.* at 396.

---

[15] The principal difference between the *Galveston* case and the present one is that in the former the deficits were determined on the basis of an assumed fair rate of return (not challenged as unreasonable) (258 U. S. at 394) whereas here the companies were financed almost entirely by the issuance of 6 percent bonds sold at a discount to affiliated companies (Ex. 137, R. 2991) and the development costs, insofar as they depend on return on investment, were calculated on the basis of interest actually paid on the bonds. This distinction is immaterial. If the cost of money is to be considered a development cost during the early years of the enterprise, it can make no difference on a present value theory of rate valuation in what form the investment is made, whether in exchange for stock or for bonds. Obviously the value of the companies is not enhanced by reason of the fact that the enterprise was financed principally by the sale of bonds to affiliated companies which also purchased all of the stock which was issued (R. 2070-2071).

The companies' attempted distinction (Br. p. 97) of the *Columbus* and *Dayton* cases is equally unavailing. While the language of the opinions in both cases (292 U. S. at 309; *id.* at 412-413) furnishes some support for the contention that the deficits there claimed were not actually incurred or were not due to the initial difficulties of operations, the fact is that the companies' witness Emery gave or supervised the testimony on going value in the *Dayton* and *Columbus* cases which was similar to and was based on the "same general principles" as his testimony in this case (R. 1961).

The only decision of this Court cited by the companies in support of the specific method of calculating going value here advanced is *City of Fort Smith* v. *Southwestern Bell Telephone Co.,* 270 U. S. 627, affirming without opinion *Southwestern Bell Telephone Co.* v. *City of Fort Smith;* 294 Fed. 102 (D. Ark.). In that case the District Court declared that a computation of the cost of attaching customers, similar to that made by the companies' witnesses in this case, was not subject to the objection that this Court had found in the estimate of going value in the *Galveston* case. 294 Fed. at 104. The affirmance of the decision by this Court, however, does not aid the companies. The city's own witness had conceded that the rate allowed by the city would have permitted less than his own estimate of a fair return on present value (294 Fed. at 108) and the cases cited by this Court in affirming leave no doubt that this was the ground on which it sustained the decree enjoining the enforcement of the prescribed rate. The Court cited *Newton* v. *Consolidated Gas Co.,* 258 U. S. 165 at 175, where it was said that "mere past success could not support a demand that it [the utility] continue to operate indefinitely at a loss"; *Galveston Electric Co.* v. *Galveston,* 258 U. S. 388, 395, announcing the companion doctrine that "Past losses obviously do not tend to prove present values"; and three other cases which, at the pages cited, merely declared that present value is controlling in rate valuation. It seems clear, therefore, that this Court affirmed the judgment of the District Court on the ground that the rate of return, based on present value, was concededly confiscatory, and

that it cited the *Newton* and *Galveston* cases as illustrative of the present value principle. It may be observed that in the only case in which this Court has cited the *Fort Smith* case, it did so on the question of the rate of return required to avoid confiscation. See *United Railways* v. *West*, 280 U. S. 234, 252n.

3. *On principle, the inclusion in the rate base of an allowance for going concern value is not required by the Constitution under any permissible theory of rate regulation*

The discussion in the preceding pages demonstrates that the decisions of this Court require rejection of the companies' contentions on the question of going concern value. The companies suggest, however, that in view of the confusion in regulatory practice resulting from the ambiguities in the opinions of this Court, the subject of going concern value in rate valuation should now be reviewed on principle. With that suggestion we are in entire agreement.

The ambiguities in the opinions of the Court are manifest. The Court has frequently said that going concern value must be given consideration and in two cases (*Denver* v. *Denver Union Water Co.*, 246 U. S. 178, 192; *McCardle* v. *Indianapolis Water Co.*, 272 U. S. 400, 413-415) has sustained a decree enjoining a rate as confiscatory because, among other reasons, it was insufficient to allow a return on going value. In the decisions cited, and particularly in the *McCardle* case, the Court seemed to require an allowance separate from and in addition to that for the physical properties. But in other decisions rendered both prior to the *McCardle* case (*Cedar Rapids Gas Light Co.* v. *Cedar Rapids,* 223 U. S. 655, 669; *Des Moines Gas Co.* v. *Des Moines,* 238 U. S. 153, 171) and subsequent thereto (*Dayton P. & L. Co.* v. *Public Utilities Commission,* 292 U. S. 290, 309; *Columbus Gas & Fuel Co.* v. *Public Utilities Commission,* 292 U. S. 398, 411; *Denver Stock Yard Co.* v. *United States,* 304 U. S. 470, 479) the Court has held that a valuation based on an appraisal of the physical assets in actual operation is sufficient, since a plant without business attached would be worth much less. While the Court has emphasized that going concern value depends on the history of the particular enterprise (*Houston* v. *Southwestern Bell Telephone Co.,* 259 U. S. 318, 324–325; *Los Angeles Gas Co.* v. *Railroad Commission,* 289 U. S. 287, 314), it has declined to consider either past deficits (*Galveston Elec. Co.* v. *Galveston,* 258 U. S. 388) or past success (*Newton* v. *Consolidated Gas Co.,* 258 U. S. 165, 175) in determining present value. See Whitten-Wilcox, *Valuation of Public Service Corporations* (2d ed. 1928), p. 1369. And, since the *McCardle* case, the Court has consistently rejected as lacking in the "requisite persuasiveness" (*Los Angeles Gas Co.* v. *Railroad Commission, supra,* at 317) every estimate of going concern value which the ingenuity of professional expert witnesses has been able to devise. *Los Angeles Gas Co.* v. *Railroad Commission supra; Dayton P. & L. Co.* v. *Public Utilities Commission, supra; Columbus Gas & Fuel Co.* v. *Public Utilities Commission, supra; Denver Stock Yard Co.* v. *United States, supra; Driscoll* v. *Edison Co.,* 307 U. S. 104, 117; see Hale, *The "Fair Value" Merry-Go-Round,* 33 Ill. L. Rev. 517, 525–531. This Court should now hold, we submit, that inclusion in the rate base of the going value of customers attached is not required under any permissible theory of rate regulation.

(a) In approaching the issue on principle, two fundamental premises must be kept in mind: *first,* that any value which is attributable solely to the monopoly position of the regulated company need not be included in the rate base; and, *second,* that any value which is based, directly or indirectly, on the earning power of the regulated company also need not be included in the rate base.

The first of these premises is obvious. A legitimate function of rate regulation is to eliminate the evils which, but for the regulation, would be caused by the monopolistic position of the regulated utility. In the case of a private, unregulated business, the prices charged are more or less effectively regulated by actual or potential competition. The rates of a monopolistic utility, on the other hand, are subject to no such competitive check. To assure that the rates will nonetheless be reasonable, the community must and does undertake to regulate them. Plainly, however, in seeking to ascertain what is a "reasonable" rate the rate making agency may at least prevent the exaction of any rates in excess of those which would be charged under conditions of competition. Any value attributable to the existence of the monopoly which is the occasion for the regulation may therefore be omitted from consideration.

This is familiar legal principle. This Court has consistently recognized that a legitimate basis of rate regulation is the existence of monopoly and the need of providing a substitute for competition as a means of preventing excessive earnings. *Munn* v. *Illinois,* 94 U. S. 113; Stone, J., dissenting in *Ribnik* v. *McBride,* 277 U. S. 350, 359–360. On principle, therefore, the legislature may lawfully reduce rates, and hence earning power, to the level which, in theory, would prevail under conditions of free competition. See Whitten, *Fair Value for Rate Purposes,* 27 Harv. L. Rev. 419, 421–423; Richberg, *A Permanent Basis for Rate Regulation,* 31 Yale L. J. 263, 267. Indeed, the theoretical justification of reproduction cost as a measure of value in rate proceedings is that it is deemed to provide a measure of reasonable charges under conditions of competition. See Bauer and Gold, *Public Utility Valuation,* pp. 397–399; Richberg, *op. cit. supra,* at 267; Whitten, *op. cit. supra,* at 423.

The second fundamental premise—that any value which is based, directly or indirectly, on the earning power of the regulated company need not be included in the rate base—is equally true and is, in large measure, a corollary of the first. The object of a rate base valuation is to fix an amount for proper measurement of reasonable rates. Since determination of such rates fixes the allowable earning power, any item which is itself based upon earning power is inappropriate as an element in the measure by which allowable earning power is determined. Under any other ruling, the dilemma is encountered that allowable earning power—i. e., the rates to be fixed—is determined upon a rate base which itself includes items based upon earning power. Since permissible earning power is thus the consequence and not the measure of reasonable rates, reasonable rates must obviously be determined by some criteria independent of earning power. See Hale, *Conflicting Judicial Criteria of Utility Rates,* 38 Col. L. Rev. 959; Bonbright, *Valuation of Property,* Vol. II, pp. 1094–1098; Bauer and Gold, *op. cit. supra,* pp. 49 *et seq.,* 141–147; Beutel, *Valuation as a Requirement of Due Process,* 43 Harv. L. Rev. 1249, 1267.

Even apart from this dilemma, however, a consideration of items based upon earning power cannot be justified. For present purposes, we need consider only earning power due to customers attached, since it is only the difference in value between an "assembled and established plant, doing business and earning money" and "one not thus advanced" which is relevant to the issue of going concern value. Cf. *Los Angeles Gas Co.* v. *Rail-*

road Commission, 289 U. S 287, 313; *Des Moines Gas Co.* v. *Des Moines*, 238 U. S. 153, 165.[16] The earning power due to customers attached is based on (a) the present consumer demand for the service, created through efforts which may historically have involved substantial expenditures, and (b) the present goodwill, if any, based on friendly relations with consumers. We discuss below the propriety of the inclusion in a rate base, computed on an investment basis, of the historical *cost* of creating consumer demand. Our point here is that it is improper to include in a rate base the present *value* of consumer demand and goodwill—in other words, earning power due to customers attached.

---

[16] Like enterprises may differ in earning power under conditions of free competition without apparent regard to relative costs of reproduction, due to differences in the efficiency of management, the market demand, or the relative adaptability of the property to the purpose for which it is employed. This may have been the thought underlying the suggestion of Mr. Justice Butler in *Denver Stock Yard Co.* v. *United States*, 304 U. S. 470, 479–480, as to the basis for determining going concern value. But the efficiency of management is not a factor to be considered in determining value in exchange and must therefore be excluded from consideration in fixing the rate basis on a present value basis. *The Minnesota Rate Cases*, 230 U. S. 352, 458. The special earning power due to public demand must, for the reasons suggested in the text, likewise be excluded in the case of a monopoly. *Clark's Ferry Co.* v. *Commission*, 291 U. S. 227, 238. And while it has been said that the element of value due to special adaptability of property to a particular use must be considered (*Clark's Ferry Co.* v. *Public Service Commission*, *loc. cit. supra*), it is difficult to see how this value can be determined without permitting the capitalization of monopoly earning power. Cf. Bauer and Gold, *op. cit, supra*, p. 274. Moreover, such special value must be due to the higher cost of reproducing the service due to the unavailability of equally efficient means. While cost of replacement of the service is the theoretical standard of free competition, the utilities would argue that the application of such a standard would frequently be unfair to the invester (Richberg, *op. cit. supra*, at 277–278) and, in fact, the reproduction cost considered in rate valuation proceedings is that of reproducing the same plant and not the same service. See *McCardle* v. *Indianapolis Water Co.*, 272 U. S. 400, 417–418. The problem of appraising the peculiar adaptability value of certain kinds of property, in any event, is a special problem not involved here and which does not materially affect the general question.

Insofar as consumer demand reflects merely a present existing general demand for the service, as distinct from consumer preference for the particular utility, it is plainly not an item of present value properly includible in the rate base. In the competitive world, the value of a particular plant is not judged by the general consumer demand for the type of articles produced by that plant, even though the creation of such general consumer demand may have required the expenditure of large sums of money in the past; the demand for the type of article already exists and consequently, goodwill aside, one who desires to engage in the business would erect a new plant rather than purchase an old one at a price in excess of the value of the physical properties. Consumer demand is relevant to the value of a particular plant, therefore, only insofar as the demand is for the particular articles produced by the plant—in other words, only insofar as the particular business has acquired goodwill.

The same principle must be applied in rate regulation. The utility, having a monopolistic position, may in practice enjoy the full benefit of the general consumer demand, but, if so, this is an advantage due to its monopolistic position and must therefore be disregarded under the first premise.

The same considerations require the exclusion of any item of present value based on goodwill. While it is not impossible for a utility to build up such friendly relations with customers that they would deal with the utility as a matter of preference (cf. Butler, J., in *McCardle* v. *Indianapolis Water Co.,* 272 U. S. 400, 413–415) the extent to which the relations between the customers and the utility are based on goodwill or necessity cannot be ascertained and it is therefore a reasonable basis for rate regulation to assume that "a consumer * * * will resort to the 'old stand,' because he cannot get [the service] anywhere else." *Willcox* v. *Consolidated Gas Co.,* 212 U. S. 19, 52; *Cedar Rapids Gas Light Co.* v. *Cedar Rapids,* 223 U. S. 655, 669; *Georgia Railway & Power Co.* v. *Railroad Commission,* 262 U. S. 625, 632. It is presumably in this view that this Court has stated that goodwill cannot be considered because it is due to a condition of monopoly. *Cedar Rapids Gas Light Co.* v. *Cedar Rapids, supra; Willcox* v. *Consolidated Gas Co., supra; Los Angeles Gas Co.* v. *Railrad Commission,* 289 U. S. 287, 313.

(b) Acceptance of these premises leads to the conclusion that the Constitution does not require going concern value to be included in a rate base under any permissible theory of valuation. The contrary view is based upon a confusion of the present value and investment principles of rate regulation.

One concept of going concern value—and a concept which the companies urge in some parts of their brief (Br. pp. 89–91)—is that it is the separate and additional value above the appraised property which is due to the fact that there is an assembled business, successfully conducted. Under this concept, going concern value is a value added to the value of the physical properties by reason of the fact that there are customers attached and existent earnings. Plainly, going concern value so conceived is based on general demand or goodwill, neither of which may be considered an element of present fair value in the regulation of a monopoly. Moreover, such going concern value is based directly upon earning power and, under the principles we have discussed, must therefore be excluded from value for rate making purposes.

A second concept of going concern value—and this concept, too, the companies urge in their brief (Br., pp. 81–82)—is that it represents, not the mere fact that the utility is a going concern, but the underlying fact that outlays or capital costs were incurred to reach the state of a going concern. In this view, going concern value is simply the developmental cost to bring the business to the state of a going concern.

So conceived, going concern value—or, more properly, going concern *cost*—is obviously not a proper item in a "present fair value" rate base, for such a rate base seeks to establish value without necessary regard to historical cost. And if it be urged that the historical development cost is simply a measure of the present value of what was obtained by the expenditure—namely, consumer demand, goodwill, and the resulting present earnings—the answer is, as we have already stated, that these items may not properly be considered in determining present value.

Furthermore, the underlying assumption of the reproduction cost theory, which is usually advanced by the utilities as the proper measure of present value, is that the existing demand for service continues and that the existing properties and organization are necessary to provide the service without interruption. Unless there were the actual and continuous demand for service there would be no need of the properties and no justification in assuming their reconstruction. The very valuation of the properties, therefore, presupposes the existence and continuance of the present demand without requiring a developmental period. Moreover, it assumes that the actual operating organization is immediately available, for otherwise the provision of the plant in full completeness at the valuation date would be unreasonable. Since the existing demand and the ability to supply the demand through suitable organization are already predicated when the physical elements are assumed to be reproduced, there remains no need for further assumed expenditures to develop such demand and full efficiency to supply it.

(c) If the "investment" rather than the "present fair value" test is used, there can, of course, be no allowance for going concern value, considered simply as the amount of the total value of a going concern over and above the physical and intangible properties; this is a *value* concept which has no place in a rate base measured by and limited to actual cost.

The same is not necessarily true, however, of going concern cost considered as the development cost necessary to bring the business to the state of a going concern. Where the development cost consists of operating or capital charges which have been returned to the utility through earnings, they may not be charged again to the consumer by inclusion in the rate base. To say that additional development costs incurred after the utility has begun to earn a fair return must be treated as an investment on which a return must be paid is to say that the Constitution guarantees the utility not only its fair but its maximum earning power. Where, however, the utility fails to obtain a reasonable return during the development period, any necessary developmental costs, to the extent that they are represented by actual deficits in earnings, may theoretically be considered as a legitimate expense which a utility should have a reasonable opportunity to recoup.

But—and this is the point which we wish to stress—the Constitution does not require that such development cost be treated as part of the investment. All that the Constitution requires, we believe, is that the investors be allowed a return sufficient to give them a fair opportunity to recoup these costs. It might be argued that this should be done by including the costs in the rate base as part of investment. Sound business and accounting practice, however, forcibly suggest that the proper method is to fix the rate of return at such a figure as to take account of the risk of loss in the development period. The risk of loss in the early years is, as Mr. Justice Brandeis observed in the *Galveston* case, "a reason for allowing a liberal return on the money invested in the enterprise," 258 U. S. at 395. If the rates imposed by regulation from the outset of the business allow a rate of return based on the risk of early loss, the inclusion of such deficits in the investment would obviously permit a double return. Lewis, *Going Value,* 26 Mich. L. Rev. 713, 729.

The soundness of considering the risk of early deficits in the rate of return and not as part of the rate base is particularly clear in view of the accounting practice to consider these outlays in the early years as operating expenses and not as part of the investment. Lewis, *op. cit. supra,* at 723. Moreover, it is difficult if not impossible to determine the extent to which the losses were due to bad management, inefficiency, improper rates, the improvidence of the investment or the inevitable expenses of initial difficulties, a consideration which forcibly argues that the risk of early losses should be taken into account in determining the rate of return rather than by including such losses in the investment. See Lewis, *op. cit. supra,* at 727–728.

Where, as here, the development period occurred prior to the commencement of rate regulation, the consideration of past losses under the "investment" test must vary according to the circumstances. If, as we have suggested, a rate regulation imposed at the outset is valid so long as it permits the investors a reasonable opportunity to recoup losses, a rate imposed after the development period may ignore past losses so long as the investors had a reasonable opportunity to amortize the amount of such losses prior to the commencement of regulation.[17] *Kings County Lighting Company* v. *Willcox,* 210 N. Y. 479, 484–494; cf.

---

[17] In Wisconsin, where the past deficit rule was originally developed, it has been consistently ruled that a utility which has amortized its early losses (on the assumption of reasonable rates prior to the beginning of regulation) is not entitled to include past deficits as investment. Numerous decisions of the Wisconsin Public Service Commission are cited in 11 Minn. L. Rev. 642, 650n.

Des Moines Gas Co. v. *Des Moines,* 238 U. S. 153, 165–166; *Lincoln Gas & Elec. Co.* v. *Lincoln,* 250 U. S. 256, 267.[18]

In any event, on the most liberal application of the investment principle, the companies in this case have no basis for complaint. The total book cost of their existing properties, including gas reserves, as of December 21, 1939, was $60,950,000.[19] There is thus a difference of approximately $13,500,000 between the companies' present investment and the rate base of $74,420,424 (R. 3937) adopted by the Commission. This amount is more than ample to allow for the $8,500,000 of "development costs" which the companies claim to have incurred. Furthermore, as we have shown (*supra*, pp. 43-44), the companies' earnings during the period from 1936 to 1938, inclusive, were more than sufficient to amortize the entire $8,500,000 and still give the companies an average return of 7.28% on their undepreciated investment.

---

[18] We are not concerned here with the question whether, if the earnings under unregulated rates had been sufficient to return part or all of the actual investment, as distinguished from operating deficits, the rates could be reduced to a level sufficient to yield a return only on so much of the investment as had not been paid back out of earnings. It may be assumed for purposes of argument that a regulatory body cannot retrospectively reduce past excessive profits by reducing present rates. Cf. *Newton* v. *Consolidated Gas Co.*, 258 U. S. 165, 175; *Board of Public Utility Commissioners* v. *New York Tel. Co.*, 271 U. S. 23, 31. It obviously does not follow, however, that development costs incurred prior to regulation must be treated as part of the present investment. The question, when investment is the basis of regulation, is whether the early losses should have been or may be deemed to have been recouped by the companies during the entire period prior to regulation, judged by the utility's own practice or that of like businesses during this period (see *infra*, pp. 90–94). If, under the company's own practice or accepted business usage, early losses may reasonably be regarded as entirely charged as a current operating expense in the years incurred, or if they may be treated as amortized by surplus earnings in the succeeding years and hence as not part of the investment, a rate which does not take into consideration any past losses so returned cannot be deemed to work an impairment of the present investment. A difficulty would arise only if rate regulation began immediately after the years of early losses, but this situation is too remote from the facts of the present case to warrant any discussion even on principle.

B. THE COMMISSION MADE A PROPER ALLOWANCE FOR AMORTIZATION

The Commission allowed $1,557,852 (R. 3941) as an annual charge for amortization or depreciation. The companies claim that the amount allowed should have been $5,100,732 (R. 4040). The Commission based its allowance on the companies' claimed actual investment, without deduction of retirements already made, of $67,173,761 through the years 1932 to 1938, inclusive, as taken from their book records, and estimated future capital additions, including replacements, through the year 1954 of $12,159,380, a total of $79,333,141 (R. 3023), less the estimated salvage value of the property at the assumed end of the project in 1954, $1,049,132 (R. 3025), a net total of $78,284,009 investment to be amortized. The annual allowance of $1,557,852 is the sum which, together with 6½ percent interest compounded annually, will equal at the end of 1954 the sum of $78,284,009 (see App. B., p. 139, *infra*).

---

[19] The figures for June 1, 1939, given in the companies' brief (Br., pp. 71-72) simply ignore the retirements of $6,526,160 charged to operating expenses (R. 2993, 3007). The figure of $49,830,479 for capital expenditures is calculated by deducting the figure of $9,367,363 for "Leaseholds" in column 8 of Exhibit 137, p. 2 (R. 2993) from the figure for "Total Plant and Equipment," $59,197,842. In adding to this the figure of $15,893,513, the accumulated expenditures for gas reserves as of Dec. 31, 1938 (Ex. 138, p. 2, R. 3007), however, the companies ignore the retirements of $6,526,160, representing the difference between the two figures for gas reserves. This amount, having been charged to operating expenses, has already been returned to the companies.

The companies contend that the rate base and amortization base should both be determined on present value, which they define as reproduction cost less observed depreciation, plus working capital and a separate allowance of $8,500,000 for going concern value, plus average capital additions until 1954 (Br. p. 6). The rate base and amortization base are not entirely the same on this theory, however, since the companies' position is that, for purposes of amortization allowance, the total estimated future capital additions of $9,145,083, exclusive of replacements, must be added and salvage value of $1,049,132 be deducted, giving a total of $84,341,218 (Br. p. 8). The companies further argue that the proper rate of interest for sinking fund purposes is 2 percent compounded semi-annually (Br. p. 10), and that the period for amortization should be limited to the years following the enactment of the Natural Gas Act or the entry of the rate order in controversy. The figure of $5,100,732 which the companies urge as the proper amortization allowance is presumably the annual allowance which, together with interest compounded semi-annually at 2 percent during this period, will yield $84,341,218.

It is apparent, therefore, that the points of difference between the companies and the Commission are these: (1) The Commission used investment as the amount to be amortized; the companies urge that it should have amortized the present fair value of the properties; (2) the Commission fixed the entire life of the enterprise as the period of amortization; the companies urge that the period of amortization should commence either as of the date of the passage of the Natural Gas Act or as of the date of the entry of the rate order; (3) the Commission computed the amortization allowance on the basis of a 6½ percent interest rate; the companies urge that it should have used a 2% interest rate. On each of these points, we believe that the Commission's action ~~was~~ clearly valid.

1. *The Commission properly provided for amortization of only the investment in the property*

Under the theory which we urge below (Point VI, pp. 112–133, *infra*), that it is only the investment and not the fair value of a utility's property which the Constitution protects—in other words, that the doctrine of *Smyth* v. *Ames,* 169 U. S. 466, is wrong—there can be no possible doubt as to the validity of the Commission's action in using investment as the amount to be amortized. Our argument at this point is that its action is correct even on the view that *Smyth* v. *Ames* correctly states the applicable constitutional principle with respect to the rate base.

The rule of *Smyth* v. *Ames* is based, as the companies assert, on the view that a rate order is a taking of the use of private property for public use for which just compensation must be paid. See *West* v. *Chesapeake & Potomac Tel. Co.*, 295 U. S. 662, 671. We undertake to challenge the validity of this view in Point VI. Even under the rule of *Smyth* v. *Ames,* however, the utility is only entitled to a "fair return on the reasonable value of the property at the time it is being used for the public." *Los Angeles Gas Co.* v. *Railroad Commission,* 289 U. S. 287, 305; *Railroad Commission* v. *Pacific Gas Co.,* 302 U. S. 388, 394–395.[20] The computation of rate of return, or net earnings, however, is directly related to the basis on which operating expense for depreciation is fixed. Cf. Brandeis, J., dissenting in *United Railways* v. *West,* 280 U. S. 234, 256. The most that the rule of *Smyth* v. *Ames* can be deemed to require, therefore, is that the rate of return on fair value be determined with due regard to the basis adopted in fixing the amount to be amortized. Where this is done, the basis for determining the depreciation charge may properly be based on considerations of sound business and accounting practice. To allow the utility a depreciation charge in excess of that assumed by the Commission in fixing allowable net earnings without a corresponding decrease in the adopted rate of return would permit the utility to earn an additional and unwarranted profit.

---

[20] A supposed justification of the rule of *Smyth* v. *Ames* as applied to the determination of the rate base is that it allows utilities the same benefit of the appreciation of property values as the owners of unregulated enterprises enjoy. See the supplement to this brief, p. 76.

Insofar as accepted practice may be deemed controlling, there can be no doubt that the Commission's choice of original cost was correct. It is almost uniform business practice to base the depreciation charge on cost. As Mr. Justice Brandeis stated in his dissenting opinion in *United Railways* v. *West,* 280 U. S. 234, 275, this is "the rule sanctioned by the universal practice of business men and governmental departments." This statement is supported in the opinion by an impressive demonstration of authority, drawn from all relevant data; we need only add that the practice has continued unchanged. In non-utility enterprises, the practice is still to base the depreciation charge on cost,[21] and all the systems of accounts established by governmental rate-making agencies, federal and state, have adopted cost as the basis of depreciation.[22] The use of original cost in determining the depreciation charge is justified, as Mr. Justice Brandeis has demonstrated, by every relevant consideration of prudent business and accounting practice.

---

[21] Gilman, *Accounting Concepts of Profit*, 348–349, 493; Sanders, Hatfield, and Moore, *A Statement of Accounting Principles* (1938), 31–32, 58–59, 60–65; Saliers, *Depreciation Principles and Applications*, 63, 68–69, 110; Montgomery, *Auditing Theory and Practice* (6th ed., 1940), 480; Paton

In determining a fair rate of return for the companies the Commission gave due regard to the fact that it had adopted original cost as the basis for determining the total amount to be amortized. To adopt present value as the basis for the amortization or depreciation charge without reducing the rate of return allowed by the Commission would permit the companies to earn a double return. This is so in part because the rate of return was based, with due allowance for the difference in risk, on the earnings and yields of securities of other enterprises. The yields of such securities, however, are based on current earnings determined after deducting depreciation on the basis of original cost and not on the basis of present value. In view of the almost universal business practice of computing the depreciation charge on the basis of cost, an in-

and Littleton, *An Introduction to Corporate Accounting Standards*, 66, 89; see also Peloubet, *Special Problems in Accounting for Capital Assets*, 61 Journal of Accountancy 185; May, *The Influence of Accounting on the Development of an Economy*, 61 Journal of Accountancy 15–16; Bell and Jones, *Auditing* (1941), 245.

[22] The systems of account referred to in note 25, pp. 80–81, *infra*, all adopt cost as the basis of depreciation.

vestor who purchases a security which is priced above par because of increased earning power cannot expect to continue to receive both a yield at the current rate and a liquidating dividend equal to the increased price of the security.

In fixing a fair rate of return for the companies on the basis of the yields on current investments, therefore, the Commission was required to guard against the allowance of the excessive return which would result if it deducted as an operating expense a larger amount for depreciation than that charged in fixing the allowance on current investments. Moreover, in fixing the rate of return, the Commission considered the fact that in computing allowable net earnings it had determined the operating expense for depreciation on the basis of cost and concluded that a 6½ percent return as so computed would be sufficient to finance the full amount of the present value of the properties included in the rate base.

In this view, the Commission's choice of original cost as the basis of amortization satisfies any possible requirement of the rule of *Smyth* v. *Ames*. The record contains and the Commission considered extensive evidence as to the yields of other securities and the earnings of the businesses on which the yields were based (R. 3939; Ex. 185–186, R. 3576–3739; cf. Exs. 147–152, R. 3071-3303). It is clear from both the evidence and the general business practice that these earnings were computed after a depreciation charge based on cost and that the yields on the securities whenever acquired represented earnings computed on the same basis. On the basis of this evidence, as well as other evidence as to comparative risks, the Commission concluded that on a sound basis of 40 percent bonds, 40 percent common stock, and 20 percent preferred stock, the entire amount of the fair value rate base, i. e., $74,420,424 (R. 3937), could be financed with earnings of 6.2 percent to 6.5 percent (R. 3939–3940). In so concluding the Commission expressly took into account that the depreciation expense to be deducted in determining net earnings was based on cost. In rejecting the companies' claim that depreciation should be based on fair value, the Commission declared: "The amounts of amortization are recognized and treated as operating expenses. Operating expenses are stated on the basis of cost. * * * We refuse to make an allowance of amortization in excess of cost. To do so would not be the computation of a proper expense, but instead the allowance of additional profit over and above a fair return. Manifestly such an additional return would unjustly penalize consumers" (R. 3938). In fixing the rate of return the Commission thus gave due regard both to the basis on which it had fixed the amount to be amortized in this case and also to the basis generally accepted in fixing a depreciation charge as reflected in the yields which it considered in determining the rate of return.

The universal business practice to base depreciation on cost is relevant for another reason, too. We are dealing here with the constitutional guarantee of due process; in its application to the present case, that guarantee, as we show below in discussing the underlying principle of *Smyth* v. *Ames,* means simply that there will be no arbitrary governmental interference with property rights. To limit a utility to a depreciation charge which is the same as that universally made by all business men, even though they are completely free of regulation, cannot in any realistic sense be characterized as arbitrary governmental action. To the precise contrary it would be the commission which blinded itself to the practical experience of business men and which thereby saddled upon consumers a charge having no basis in business realities which would be guilty of arbitrary conduct.

United Railways v. *West,* 280 U. S. 234, 253, is, we admit, opposed to our position. The case is distinguishable, however, on the narrow ground that the Court was there dealing with the depreciation of a utility with an indefinite life and which was therefore faced with the necessity of replacing physical properties the service life of which was exhausted; the rationale of the decision that depreciation should be based on fair value rather than original cost was that the former more accurately measured replacement cost than the latter. Here, on the other hand, we have a utility with a limited life expectancy and with physical properties that will, in the main, outlast its gas reserves; there is, therefore, no real problem of replacement at all.[28]

This distinction, however, is not a satisfactory disposition of the matter because, for the reasons we have advanced, the *West* case is wrong on principle. It is opposed to the statement of this Court in *United States* v. *Ludey,* 274 U. S. 295, 300–301, a federal income tax case, where the Court said: "The amount of the allowance for depreciation is the sum which should be set aside for the taxable year, in order that, at the end of the useful life of the plant in the business, the aggregate of the sums set aside will (with the salvage value) suffice to provide an amount equal to the original cost." And it is opposed to the statement of this Court in *Lindheimer* v. *Illinois Bell Tel. Co.,* 292 U. S. 151, 167, that "In determining reasonable rates for supplying public service, it is proper to include in the operating expenses, that is, in the cost of producing the service, *an allowance for consumption of capital in order*

---

[28] Moreover, we submit that present value has no predictable relation to future replacement cost (see Brandeis, J., dissenting in *United Railways* v. *West,* 280 U. S. 234, at 278), and is certainly no more reliable a test for this purpose than is original cost. See Stone, J., dissenting in *United Railways* v. *West,* 280 U. S. at 289–291.

to maintain the integrity of the investment in the service rendered." [Italics supplied.] See also *Knoxville* v. *Knoxville Water Co.*, 212 U. S. 1, 13, 14. Mr. Justice Butler, in his concurring opinion in the *Lindheimer* case, stated that the method of depreciation approved by the majority was not in harmony with the principle of the *West* case, 292 U. S. at 176. And the Virginia Supreme Court of Appeals, in *Alexandria Water Company* v. *City Council of Alexandria*, 163 Va. 512, stated that the *West* case was, in its view, at least inferentially overruled by the *Lindheimer* case. It is significant, too, that despite the *West* case, the federal and state utility commissions, almost without exception, have continued to follow cost accounting for depreciation.[24]

[24] *Re Telephone and Railroad Depreciation Charges*, 177 I. C. C. 351; *Re North West Tel. Co.* (Wis.), P. U. R. 1931A, 53, 56–7; *Re Long Branch Sewer Co.* (N. J.), P. U. R. 1931A, 467, 473; *Re Patrons of Lakeville Water Co.* (Conn.), P. U. R. 1932D, 138; *Re Yonkers Railroad Co.* (N. Y.), P. U. R. 1933B, 61, 84; *Re Mondovi Tel. Co.* (Wis.) P. U. R. 1933B, 319, 330; *Re Mondovi Tel. Co.* (Wis.), P. U. R. 1933D, 142; *Re Lincoln Tel. & Tel. Co.* (Neb. 1935), 6 P. U. R. (N. S.), 81, 90; *Alexandria Water Co.* v. *City Council of Alexandria* (Va. 1935), 7 P. U. R. (N. S.), 53, 113; *Re Yonkers Railroad Co.* (N. Y. 1935), 9 P. U. R. (N. S.), 337, 365; *Re Wisconsin Tel. Co.* (Wis. 1936), 13 P. U. R. (N. S.), 224, 251; *Re Peoples Gas Light & Coke Co.* (Ill. 1937), 19 P. U. R. (N. S.), 177, 257; *Re Northern States Power Co.* (N. D. 1938), 22 P. U. R. (N. S.), 364, 370; *Pacific Tel. & Tel. Co.* v. *Wallace* (Ore. 1938), 23 P. U. R. (N. S.),

In the light of all these considerations, this Court should now, we submit, expressly overrule the *West* decision and hold that, even under the rule of *Smyth* v. *Ames,* rates which provide for a full return of the original investment plus a fair return on the present fair value of the property included in the rate base, satisfy all constitutional requirements.

2. *The Commission properly fixed the amortization period as the entire life of the enterprise*

It has been shown that the charge for depreciation must be based upon cost. The next question is as to the amount of the total cost the companies are entitled to charge for depreciation in the fu-

---

65, 86; *Re Northern Power & Light Co.* (N. D. 1939), 30 P. U. R. (N. S.), 1, 5; *Re North Dakota Power & Light Co.* (N. D. 1940), 31 P. U. R. (N. S.), 26, 29; *Re Alabama Water Service Co.* (Ala. 1940), 32 P. U. R. (N. S.) 129; *City of Los Angeles* v. *Nevada-California Electric Corp.* (Fed. Power Comm. 1940), 32 P. U. R. (N. S.), 193, 204; *Re Otter Tail Power Co.* (N. D. 1940), 33 P. U. R. (N. S.), 301, 306; *Re Swan Creek Electric Co.* (Utah 1940), 35 P. U. R. (N. S.), 315, 316; *Re Central Light & Power Co.* (N. D. 1941), 37 P. U. R. (N. S.), 106, 111. The *West* case, wherever considered by the commissions in these cases, was criticised as unsound. Economists and accountants have likewise insisted that cost is the only proper basis of utility depreciation accounting. Mosher and Crawford, *Public Utility Regulation* (1933), 160–162; Jones and Bigham, *Principles of Public Utilities* (1937 ed.), 491 *et seq.;* Wilson, Herring and Eutsler, *Public Utility Regulation* (1938), 196 *et seq.;* see also Haun, *Inconsistencies in Public Utility Depreciation,* 38 Mich. L. Rev. 160, 479.

ture. The answer to this question depends upon the nature of depreciation and the proper method of accounting for it.

The Commission's conclusion that amortization should be regarded as an "operating expense" based on "cost" (R. 3937) reflects the view, now accepted by almost all informed opinion, that depreciation is the diminution of the service capacity of the property or, in terms of the monetary measure of the original service capacity, the diminution in service value. See *Proceedings of the National Association of Railroad and Utilities Commissioners,* 1938, pp. 441–443; *Telephone and Railroad Depreciation Charges,* 177 I. C. C. 351, 372–382. This is the uniform conclusion of all rate-making agencies, both federal and state.[25] This, too, is the view expressed by this Court in *Lindheimer v. Illinois Bell Tel. Co.*, 292 U. S. 151, 167. This view of depreciation is based on the simple principle that the economic value of property—its ability to earn a return—consists of the total units of useful service which it is capable of producing. Paton and Littleton, *Introduction to Corporate Accounting Standards*, p. 84; Porter and Fiske, *Accounting*, p. 406; Taussig, *Principles of Economics*, Vol. I, p. 70; *Proceedings, supra*, pp. 444-445; *Telephone and Railroad Depreciation Charges, loc. cit. supra.*

---

[25] The Uniform System of Accounts for Natural Gas Companies promulgated by the Federal Power Commission, effective January 1, 1937, defines depreciation as "the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of gas plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and requirements of public authorities, and, in the case of natural gas companies, the exhaustion of natural resources." Service value is defined as "the difference between original cost and net salvage value." See also Uniform System of Accounts for Class A and Class B Telephone Companies promulgated by Federal Communications Commission, effective January 1, 1937; Uniform System of Accounts for Electric Utilities promul-

The annual depreciation is thus the amount of the service capacity which has been consumed in any one year. The service capacity used up in any one year is a cost of operation just as much as fuel or any other property which is totally con-

---

gated by the Federal Power Commission, effective January 1, 1937; Uniform System of Accounts for Electric Utilities recommended by the National Association of Railroad and Utilities Commissioners (1936); Uniform System of Accounts for Natural Gas Companies recommended by the National Association of Railroad and Utilities Commissioners. Twenty-seven states have adopted the Federal Communications Commission system for Class A and Class B telephone companies identically; eight have adopted it substantially; no system is prescribed in the other states. See Federal Communications Commission Release, August 18, 1941, Accounting Systems Prescribed by the States for Use of Telephone Companies. Similar systems have been adopted by the majority of states for electric and gas utilities. See *State Commission Jurisdiction and Regulation of Electric and Gas Utilities*, published by the Federal Power Commission, January 1941, pp. 11, 35.

sumed, physically and economically, during the year. As this Court observed in *Illinois Central Railroad* v. *Interstate Commerce Commission,* 206 U. S. 441, 462, "It would seem as if expenditures for additions to construction and equipment, as expenditures for original construction and equipment, should be reimbursed by all of the traffic they accommodate during the period of their duration * * *." It is for this reason that in fixing reasonable rates there should be included in "operating expenses, that is, in the cost of producing the service, an allowance for consumption of capital * * *." *Lindheimer* v. *Illinois Bell Tel. Co.,* 292 U. S. 151, 167. As stated by the companies' witness Cooke, "Depreciation reserve is a charge made to operations over a given period of time, which is intended to recover the amount invested in the fixed asset which is used up or worn out in that time; in other words, to recover the capital investment within the useful life of the property" (R. 2620):

In this case, eight and a half years elapsed between the time of the beginning of business by the companies and the effective date of the rate order and in that time a considerable part of the service life of the plant assets was used up. Consequently, it would be contrary to fact to make the assumption that no part of the service life of the assets should be charged to the prior period.

The companies concede this in principle; they admit that the physical or "viewed" depreciation must be deducted (Br. p. 8) although they ignore the controlling factor of functional depreciation due to the exhaustion of the gas supply. The real question in the case, therefore, is not what period of amortization should be used, but what amount should be considered as charged for depreciation for the period prior to the rate order.

The Commission has in effect concluded that, of the total cost to be amortized, the sum of $13,317,921 should be considered as charged for depreciation during the seven-year period ending December 31, 1938 (see App. B, p. 139, *infra*), a date which is taken merely for purpose of convenience in making comparison with the record evidence as to the companies' past practice. The companies contend that the accrued depreciation is only $2,485,079 for the same period (Ex. 141, R. 3025). The Commission's conclusion is, we submit, amply sustained by the record, both on the "fair value" and "investment" theories of rate regulation. Cf. *Clark's Ferry Co.* v. *Public Service Commission,* 291 U. S. 227, 240; *Georgia Railway & Power Co.* v. *Railroad Commission,* 262 U. S. 625, 633; *Peoples Gas Light & Coke Co.* v. *Slattery,* 373 Ill. 31.

(a) On the theory of *Smyth* v. *Ames* that it is the property and not the investment which the Constitution protects, the actual past depreciation of the property must be deducted in order to determine what property must be returned to the companies in the future. *Knoxville* v. *Knoxville Water Co.,* 212 U. S. 1, 13–14; *Minnesota Rate Cases,* 230 U. S. 352, 456–458; *Lindheimer* v. *Illinois Bell Tel. Co.,* 292 U. S. 151, 157, 167.[26] We have shown that the actual past depreciation is the diminution of service capacity that has occurred.

The diminution of service capacity may best be measured in units of time elapsed or of service rendered. See *Proceedings of the National Association of Railroad and Utilities Commissioners,* 1938 pp. 441–443; *Telegraph and Railroad Depreciation Charges,* 177 I. C. C. 351, 402.[27] And ample data for the reasonable application of either measure is contained in the record. There is voluminous evidence, based on actual experience and observed conditions at the time of the proceedings (cf. *Lindheimer* v. *Illinois Bell Tel. Co.* 292 U. S. 151, 169–170; *McCardle* v. *Indianapolis Co.,* 272 U. S. 400;

---

[26] On this theory, business and accounting practice in making provision for the cost of operation represented by the consumption of service life is immaterial. If past charges for depreciation have been excessive, the utility may retain the benefit. *Board of Public Utility Commissioners* v. *New York Tel. Co.,* 271 U. S. 23. If past charges have been inadequate, the utilities must bear the loss. *Knoxville* v. *Knoxville Water Co.,* 212 U. S. 1, 13–14.

[27] The units of service or production method is impractical in the case of many utilities and depreciation expense in such cases is therefore usually measured on a time basis. *Telegraph and Railroad Depreciation Charges,* 177 I. C. C. 351, 403.

416), as to the actual past withdrawals of gas and probable future withdrawals on which the service life of the properties depend (R. 629–646), the physical condition of the properties (R. 1286–1309), the actual rate of their use in the past (R. 206–211) and estimates of future use based on "the controlling test of experience". *Lindheimer* v. *Illinois Bell Tel. Co., supra,* at 170.

The total service life of the depreciable property is limited, as the companies' witnesses testified, by the supply of gas. The companies' witnesses have estimated that the gas supply in the field on which they depend will be exhausted at the end of the year 1954, and that on that date, therefore, the properties now in service must be retired (R. 3936).[28] The companies' evidence shows that physical wear and tear has been a relatively negligible factor (see *infra*, pp. 89–90) and that the withdrawals from the gas field have not and will not require curtailment of the companies' operations below the 1936–1938 average (R. 692), during which the companies operated at the load factor of 92.48% (R. 1330), as close to 100% of total utilization as is practicable in actual operations (R. 632).[29]

---

[28] This estimate is based on the rate of past withdrawals by all gas companies, which is an ascertainable fact (R. 206–211) and the rate of future withdrawals, which of course can only be an approximation (R. 629–646). While the estimate may thus require revision in the light of actual experience, an estimate must be made now for the purpose of fixing rates since accrued depreciation and future depreciation expense must both be based on the total service life determined in accordance with the most reliable data now available. Cf. *Lindheimer* v. *Illinois Bell Tell. Co.*, *supra*, at 171–172, 174.

On these facts, it would have been reasonable to conclude that an equal amount of service capacity is lost each year. On the view most favorable to the companies, the depreciation, as the witness Kleinman testified, should be computed on the basis of the actual amount of gas withdrawn and sold by the two companies, thus excluding the physically potential service capacity which allegedly could not be used by reason of limitations of the market demand (cf. R. 2431). The companies' evidence as to the actual rate of use of their facilities in the past (R. 1330) and the probable rate of use in the future (R. 692) provide reliable data on which to determine the total original service capacity and the percentage which has been consumed in actual operations in the past. On the basis of this evidence, the Commission would have been entitled to conclude that the loss of service capacity during the seven-year period was approximately 25 percent of the total.[30]

---

[29] It is true that the withdrawals from the field in the past apparently increased slightly from year to year (R. 209) and that this tendency might continue in the future (R. 639), although the companies' witness Dickinson estimated that it would even off in 1942 (R. 645). The absence of uniformity in past or future withdrawals, however, is immaterial. The companies used the average of the years 1936–1938 in computing normal operations throughout the service life, both in their estimate of a 92% operating load factor on which to base "going concern" value (R. 1330) and in their testimony as to future revenues (R. 1401). For all practical purposes, therefore, it is reasonable to assume that the companies' properties have been and will continue to be capable of maximum use throughout the life of the gas reserve without regard to the variations in the rate of total withdrawals by all gas companies withdrawing from the same field. There was some evidence that the limitation of supply would require a reduction of output in the last two or three years (R. 762), but there was other evidence that the companies' estimate was overly conservative (R. 53–54, 1880, 1887).

We have shown above that the monetary measure of depreciation is original cost. The loss of service value, therefore, is a very minimum of about

---

[30] This figure is arrived at as follows: The witness Emery took the operating load factor of 92.48%, the three-year average for 1936–1938 (R. 1329–1330), as the measure of normal operations in measuring the "going value" of the property, and other witnesses for the companies' computed future revenues on the same 1936–1938 basis (R. 692). Taking this average at 100, Emery calculated that the percentage of unused capacity, allowing for a change in rated capacity in the early years, was approximately 52% in 1932, 56¾% in 1933, 21½% in 1934, and 3½% in 1935, or an average of about 33⅓%. The change in rated capacity during this period was from 175,000,000 cubic feet per day to 210,000,000 cubic feet per day (R. 1330), that is, the earlier capacity was only 83⅓% of the later. Thus the average used capacity in the first four years was two-thirds of 83⅓% or 55½% of the later years. Taking the useful capacity for each of the last 19 years at 100 and the useful capacity of each of the first four years at 55½, the total capacity may be represented by

25 percent of $59,197,842.69, the cost as shown on the companies' books for the property as of December 31, 1938, or approximately $14,500,000. This is exclusive of $6,526,160 for retirement of gas leases, this sum being the difference between the original cost and the book cost for leases shown as of December 31, 1938 (R. 2993). This amount should be added since it was included by the Commission in the total sum to be amortized (R. 3938). Thus the sum to be deducted from the total amount to be amortized after December 31, 1938, is about $21,000,000, a sum substantially in excess of the amount which the Commission's method of amortization credits to depreciation reserve for these years. See *supra,* p. 83.

The validity of this conclusion is amply confirmed by the companies' own practice. The companies' books show a total of $19,558,810 for this seven-year period for depreciation, depletion, and retirements, the latter having been charged as an

---

1900 plus 222, or 2122. On this basis the capacity consumed in the first seven years is 522, representing 222 for the first four years and 300 for the next three years of full capacity, or slightly less than 25% of the total.

The companies' witness Biddison recognized the propriety of determining accrued depreciation on the basis of the percentage of total service capacity consumed in past operations when he calculated the depreciation of the companies' automobiles on the basis of the relation of past mileage to total mileage life (R. 1305-1306). The same witness, however, used the inconsistent and, as we show below (see *infra*, pp. 89-90), indefensible "viewed depreciation" method in estimating the depreciation of all other property of the companies.

operating expense by direct credit to plant account rather than to the depreciation reserve (R. 2959). In the absence of persuasive evidence to the contrary, this amount may be taken as the companies' own estimate of the actual depreciation expense, including the cost of retirements, during the years in question. Cf. *New York Telephone* v. *Prendergast*, 36 F. (2d) 54, 66 (S. D. N. Y.). The companies' suggestion (Br. p. 120) that the amounts set up in their books for these purposes were merely bookkeeping entries is entitled to no credence. The companies' accounting practice was based on studies of service lives and made in accordance with expert advice (R. 2643–2645). The Commission did not believe, and this Court can hardly assume, that the companies, in providing for depreciation, took no account of the current exhaustion of the gas wells or that, ignoring all expert opinion, they failed to treat depreciation expense as an actual expense for the current consumption of capital. See the testimony of the companies' witness Cooke at R. 2619.

The only evidence to which the companies can point in support of a contrary conclusion is the testimony of their witness Biddison. Biddison's estimate of "viewed depreciation" as of January 1, 1939, was only $2,485,079 (Ex. 141, R. 3025). His estimate, however, was based solely on the "physical condition" of the property (R. 1284–1286, 1293–1295). It thus took no account of the controlling factor of the gradual exhaustion of the gas reserves, a factor which was constantly in operation throughout the life of the physical properties. Biddison's method of determining accrued depreciation, which assumes that depreciation is limited to the loss of current operating efficiency and ignores the continuous consumption of the capital invested in the properties, is obviously absurd. It attributes to property which has lost a large part of its total service capacity a present value of only 4.4% less than its value new. And the companies, logically enough, have drawn the indefensible conclusion that no further depreciation will occur throughout the entire life of the properties, assuming proper maintenance (cf. Ex. 142, R. 3029–3031).

(b) On the investment theory of rate making, it is equally clear that the amount in effect allocated by the Commission to past depreciation is reasonable. Since the purpose of depreciation on an investment basis is to give the investors back their full investment at the expiration of the life of the business, the amortization of the investment may be, and under common practice always is, spread over the whole life of the property; any method of amortization of the investment over the whole life of the property is proper so long as it provides a "reasonable plan of distribution." See Brandeis, J., dissenting in *United Railways* v. *West*, 280 U. S. 234, 263–264. In other words, on the investment basis the relation between the rate of depreciation and the return of investment is a matter of sound business accounting. See Bonbright, *Valuation of Property,* Vol. 2, pp. 1139–1140.

If rate regulation had been imposed at the outset of the business, it would clearly have been a reasonable method of distributing amortization, and indeed, the only reasonable method, to spread it over the whole life of the enterprise by granting an amortization allowance each year. This could validly have been done either on a straight line, actual consumption of service, or on a sinking fund basis which defers some of the amortization until the later years. See *Clark's Ferry Co.* v. *Public Service Commission,* 291 U. S. 227, 240–241.

Where, as here, rate regulation is directly imposed for the first time after part of the life of the enterprise has expired,[31] the same methods of amortization may validly be employed, at least so long as their use does not defeat any legitimate past expectations of the investors. In *Knoxville v. Knoxville Water Co.,* 212 U. S. 1, it was held that, in fixing a rate base which reflected depreciation accrued in the past, it was proper to take into consideration not only the actual consumption of the service capacity of the property in the preceding years of the utility's life, but also depreciation reserves for which the company should have made provision in discharge of its "duty to its bond and stockholders." 212 U. S. at 13–14.

---

[31] The Court should note that the business of the companies was of a public character from the day it commenced operation. Several million inhabitants of Chicago and the northern part of Illinois were immediately dependent upon it for gas service. To demonstrate the reasonableness of its contract with Chicago District Pipeline Company, the companies presented evidence of the estimated earnings of the project before the Illinois Commerce Commission in 1931 (R. 3320, *et seq.;* R. 3335, *et seq.*). Subsequently, as a result of this inquiry and the refusal of the Illinois Commerce Commission to approve Chicago District Pipeline Company's contract with the Chicago gas distributing utilities, the companies reduced their rates to the Chicago District Pipeline Company. In *Natural Gas Pipeline Co.* v. *Slattery*, 302 U. S. 300, this Court upheld the right of the Illinois Commerce Commission to have access to the companies' books and records in a new proceeding involving the reasonableness of the rates and charges of the Chicago District Pipeline Company.

It is true that in the *Knoxville* case accrued depreciation was apparently based upon fair value rather than investment. But the rationale of the decision was that it was proper to compute the rate base for the future on an assumption as to the proper depreciation reserves which the company itself should have set up in the past in pursuance of its duty to its investors. This principle is, ~~we submit,~~ clearly correct, since the retroactive application of a statute is constitutionally objectionable under the due process clause only where such application undermines without notice reasonable assumptions upon which those subject to the statute have acted in the past.

In this case the assumptions which the Commission made as to the amortization practice which the companies adopted or should have adopted in the past were clearly reasonable and cannot be said to have defeated any legitimate expectations of the companies. To adopt the contrary view that the entire amortization should be attributed to the future life of the enterprise means that the Commission was constitutionally required to assume that the companies did not in fact, or should not have been expected to, make any provision for amortization of investment out of their earnings during the first eight and a half years of their life expectancy of 23 years.[32]

Stated somewhat differently, during the period prior to the rate order the companies must have earned enough to return a reasonable portion of their investment unless their enterprise was improvidently conceived or the management was either inefficient or imprudently failed to maintain a proper reserve "to keep the investment unimpaired." *Knoxville* v. *Knoxville Water Co., loc. cit. supra; Lindheimer* v. *Illinois Bell Telephone Co.,* 292 U. S. 151, at 169; Brandeis, J., dissenting in *United Railways* v. *West,* 280 U. S. 234, at 264. We are not urging that the companies' past earnings may now be retroactively restricted to an amount which would have been reasonable if they had always been subject to regulation; we do urge, however, that the Constitution does not guarantee the companies against any loss of their investment due to past improvidence.

---

[32] The companies rely on two cases involving the United Fuel Gas Company (*United Fuel Gas Co.* v. *Kentucky Railroad Comm.*, 13 F. (2d) 510 (E. D. Ky.), affirmed 278 U. S. 300; *United Fuel Gas Co.* v. *W. Va. Pub. Serv. Comm.*, 14 F. (2d) 209 (S. D. W. Va.), affirmed 278 U. S. 322) to sustain their position. However, from the companies' own statement of the cases (Br. 123–127) it is obvious that these decisions, far from supporting their contention, are in accord with what the Commission did in this case. In the Kentucky case, it was specifically held that "a depletion charge, in estimating the reasonable rate, must be figured upon the investment value, and over the entire estimated life of the properties." 13 F. (2d) at 523. The court's observation that the company is entitled to receive back its entire investment, plus a reasonable return upon such investment, "during the dedication of it to public use" (13 F. (2d) at 523) obviously means during the period of operations, and, as was actually held in the case, the period before regulation may be considered. In the West Virginia case, the Commission deducted the past accrued depreciation and amortization from the present fair value, which it reluctantly used as the amortization base, and amortized the balance over the re-

As we have noted, the amount ($19,558,811.44) which the companies charged for depreciation, depletion, and retirement [33] during the years 1932 to

---

maining life. P. U. R. (W. Va.) 1925B 705, 743–747. The past accrued depreciation was estimated by taking a certain percentage of earnings during the past operations, although the period did not include the entire period of past operations. It is clear, however, that the period chosen was not dependent on the absence or presence of a regulatory statute, since the company was regulated even prior to the period chosen. The District Court reduced the allowance for future amortization because it concluded that the Commission's estimate of service life was too short. 14 F. (2d) at 211. In neither case was the question of the proper period of amortization before this Court.

[33] The companies charged retirements as an operating expense and did not pay them out of depreciation reserve (R. 3904).

1938, inclusive (R. 2959) is larger than the amount of amortization of investment attributed to those years ($13,317,921) under the sinking-fund method adopted by the Commission (App. B, p. 139, *infra*). Plainly, therefore, the action of the Commission finds ample justification in the companies' own judgment as to the amount of the investment which should have been returned in the past under prudent management.

3. *The Commission used a proper rate of interest in computing the amortization allowance.*

The companies contend that the amortization allowance should have been computed on the basis of 2% interest compounded semiannually rather than on the basis of 6½% interest compounded annually and that the Commission's failure to do this invades their constitutional rights. They advance this contention to the Court in all earnestness despite the fact that they themselves, prior to actual operation but after construction had begun, planned for amortization of their investment by the use of the sinking fund method, using interest at the rate of 6% (R. 3567–3572).[34]

The companies' contention is based on the ground that it is impossible to invest a fund in risk free securities at more than a 2% interest rate. The argument, however, misconceives the nature of the sinking fund method used by the Commission. The companies speak of the method as though it provided for an actual fund to be handed over to a trustee and invested, as in the case of the sinking funds provided for in many trust indentures to retire outstanding bonds. No such actual fund was created or contemplated by the Commission here; rather the Commission used a mathematical sinking fund formula to compute that return from the earnings of the property which would provide not only a fair return on the unamortized portion of the rate base but also a full return of the investment. The sinking fund method, as applied by the Commission in this case, is similar to the usual accounting and financial treatment of this device (R. 2096; R. 1910 *et seq.*). It is designed to permit the utility to include each year in its operating expenses a sum which, with interest compounded annually during the remaining service life of the property

---

[34] In practice, however, after the companies began operation, they failed for a time to make any provision for depreciation or amortization. In 1934, as the companies' secretary explained (R. 2643–2645), this neglect was criticized

---

by both the Federal Trade Commission and their own privately employed auditing firm. Thereupon, the companies set up a committee to consider the problem. Studies were made, service lives of the various classes of property were estimated, and provision from then on made predicated upon book cost and apparently on a straight-line basis (R. 2645). Between the years 1932 to 1938, inclusive, the companies charged to depreciation, depletion, and retirement the sum of $19,558,811.44 (R. 2959).

at a rate identical with the adopted rate of return, will yield a sum equal to the total amount to be amortized.

In form, the sinking fund method provides for a 6½% return, plus amortization allowance, on a rate base from which no deduction for amortization has been made; in effect, by computing the amortization allowance on a 6½% basis, the formula provides the companies with (1) a 6½% return on the unamortized portion of the rate base; plus (2) the amortization allowance (i. e., the amount which, together with interest of 6½% compounded annually over the amortization period, will equal the investment in the properties); plus (3) an amount equal to 6½% on the amortization reserve.

That this is the effect of the Commission's formula can readily be demonstrated by reference to the example set forth in Exhibit 182 (R. 3553). That example assumes that there is a utility with properties worth $1,000,000, that a fair return on those properties is 8%, and that the life of the properties is 10 years. On this assumption, an annual amortization allowance of $69,029, with interest at 8% compounded annually, is required to return to the utility the full $1,000,000 value of its properties. By allowing the utility 8% upon the full $1,000,000 throughout its life, plus an annual amortization allowance of $69,029, the utility is given each year, as the exhibit shows, an

8% return on the unamortized portion of the rate base, an annual amortization allowance, and 8% on the entire amortization reserve. Over the full 10-year period, therefore, the utility will receive, by way of amortization allowance and interest on amortization reserve, the full $1,000,000 to be amortized, plus an annual 8% return on the unamortized portion of the rate base.

This will become readily apparent by taking the figures for just the first two years. In the first year the rate base is $1,000,000, the return on that rate base at 8% is $80,000, and the amortization allowance is $69,029. In the second year, the unamortized portion of the rate base is $1,000,000 less the amortization reserve of $69,029, or $930,971. Nevertheless the utility is allowed an 8% return on the full rate base of $1,000,000, or $80,000. $74,477 of this $80,000 represents an 8% return on the unamortized portion of the rate base ($930,971) and the remaining $5,523 represents an 8% return on the amortization reserve of $69,029. It is thus evident that by applying the rate of return figure to the full rate base, what the Commission in effect does is to allow that rate of return on the unamortized portion of the rate base plus interest, at the same figure as the rate of return, on the amortization reserve.

As applied to this case, the formula provides the companies out of the earnings of the enterprise, not only with a 6½% return on the unamortized portion of the rate base; but also with an amortization allowance, computed on the basis of 6½% interest, and with 6½% interest on the amortization reserve. Accordingly, no question is presented as to the rate of return which could be earned by an actual fund invested in risk free securities.

It is to be noted that if a rate of interest lower than the 6½% rate of return allowed on the rate base—for example, the 2% figure suggested by the companies—were used to compute the annual amortization allowance, the utility would be receiving 6½% interest on its amortization reserve, even though the amount of the annual amortization allowance was computed on the assumption that only 2% was to be earned. The excess of 4½% interest on the amortization reserve over that which is necessary to return the entire investment is, in substance, an added return on the unamortized portion of the rate base over the 6½% return found to be fair and reasonable. The example in Table II of Exhibit 182 (R. 3555) shows that, in the case of the assumed $1,000,000 enterprise which has a life expectancy of 10 years and which is allowed an 8% return on rate base, the effect of computing the amortization allowance at 2% rather than at 8% is to allow the company an average return on the unamortized portion of the rate base, not of 8%, but of 12.59%.

The only possible objection to the method which the Commission used is that it requires investors to look for their interest on the amortization reserve to the earnings of the business and therefore involves some risk to them. If a straight line method of depreciation had been used, or if an actual sinking fund had been set up allowing the investment of the amortization allowance in risk free securities at 2%, this risk of amortization would not be present. But, if either of these methods had been used, the average annual amortization allowance would have been greater, the unamortized portion of the rate base would have been correspondingly smaller, and, accordingly, the 6½% return on the unamortized portion of the rate base would have been smaller. The larger return on rate base allowed under the Commission's method is a precise measure of reward for the additional risk arising out of the fact that the companies must look to the earnings of a 6½% business rather than to those of a 2% business for their amortization, for the additional return is exactly proportionate to the difference between the interest rate of the supposed riskless investment and the larger rate of return allowed on the companies' business by reason of its supposed risk. If the rate of return is properly determined, the difference in reward will correspond exactly with the difference in return which an investor would ask for taking the additional risk.

C. THE COMMISSION PROVIDED A PROPER RATE OF RETURN

The Commission found "that 6½ percent is a fair annual rate of return upon the rate base allowed" (R. 3940, 3945). Under Section 19 (b) of the Act that finding is conclusive if it is supported by substantial evidence. The court below held that there was substantial evidence in the record to support the finding and its decision in this respect is plainly correct.

In *Bluefield Co.* v. *Public Service Comm.*, 262 U. S. 679, 692–693, this Court pointed out the elements to be considered in determining a fair rate of return:

> * * * A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional rights to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and to enable it to raise the money necessary for the proper discharge of its public duties. A

> rate of return may be reasonable at one time and become too high or too low by changes affecting opportunities for investment, the money market and business conditions generally.

See also *Willcox* v. *Consolidated Gas Co.*, 212 U. S. 19, 48–50; *Lincoln Gas & Elec. Co.* v. *Lincoln*, 250 U. S. 256, 268.

Under this test, the 6½% rate which the Commission allowed was clearly reasonable. The evidence shows that profits earned by industrial corporations declined from 11.3 percent on invested capital in 1929 to 5.1 percent in 1938; for utility corporations, profits declined from 7.2 percent to 5.1 percent during the same period; and for railroad corporations the decline was from 6.4 percent to 2.3 percent (Ex. 185, Schedule 17, R. 3697, 3699). Interest rates were at a low level on all forms of long and short term investments and the rates of return demanded by investors were among the lowest that ever existed (Ex. 180, R. 3523; Ex. 185, schedules 1 to 5, R. 3581, *et seq.*). Specifically, securities of natural gas companies were being sold at rates of from 3 to 6 percent with the yields on the bulk of the bond issues falling between 3 and 4 percent. Banks were making large loans at interest rates of from 2 to 3.25 percent in most cases (Ex. 181, R. 3525–3552; Ex. 186, schedules 6, 7; R. 3777, 3779). The Commission was certainly warranted in concluding upon these facts that 6½% was a generous return unless the enterprise was subject to extraordinary risks. Indeed, the companies scarcely urge the contrary.

There was also abundant evidence showing not only that the companies faced no extraordinary risks but that even less risk of loss of capital investment attended the enterprise than the risk to which the ordinary utility is subject.

First, the companies have unusual assurances of an outlet for their product. Metropolitan Chicago is a growing industrial area and forms a thoroughly desirable market. The companies in effect have both a legal and a practical monopoly of the territory, for although they do not service the community directly, the utilities which do service it own 26 percent of the investment in the pipeline company and are really partners in the enterprise (R. 1945). Consequently there is no danger of competition from a new source of supply (R. 2543–2544), while the advantages of gas for many uses offset to a large extent the possibility of losses to competing fuels (R. 3440, 3456, 3485).

Decisive on this point, however, is the fact that 90% of the companies' capacity is taken under the contract with the Chicago District Pipeline Company, which contract is to run until 1946, or until 1951, at the option of the companies (R. 3). Chicago District is bound to take, or at least pay for, over 66⅔%. The contract is guaranteed by the three distributing utilities in Chicago. Few companies can show such complete protection against the risk of losing the market.

Second, the fact that the companies are engaged in an extraction industry is not a risk which is to be reflected in the rate of return. In estimating the life of the natural gas field in order to calculate the amortization period, the dangers of early exhaustion have been taken into account as well as the possibility that the enterprise will live longer than the estimated period. A second allowance for those factors of risk should not be made in the rate of return. To the contrary, the fact that the entire investment is to be amortized over a relatively short period gives the companies security lacking in most industries where capital investments are relatively permanent.

Third, the companies' corporate affiliations make their financial future relatively secure. The resources of the six large corporations which directly or indirectly own all of the stock (p. 9, *supra*) provide assurance that the companies can readily obtain any future capital requirements. Compare *Wabash Valley Electric Co.* v. *Young*, 287 U. S. 488, 501.

Fourth, while the companies stand in the same position as any other corporation in respect to many miscellaneous lesser risks—increased taxes, costs of regulation, inflation, costs of operation, mechanical failures and so forth—the evidence shows that they are more favorably situated in respect to others. The problem of converting inventory into cash is not as great (R. 2082–2084); the labor factor is not as great (R. 2084); credit risks scarcely exist (R. 2084–2086); and risks arising out of varying demands for a product and because of technological changes are small (R. 2086–2088).

The foregoing proof plainly warranted the Commission in concluding that the companies faced no extraordinary dangers of capital losses which should be compensated by extra returns and that they had, on the contrary, a relatively secure investment. There was also evidence that before the enterprise was under way the companies themselves estimated that their return would be approximately 6.3 percent before federal income taxes (Exs. 156, 157, R. 3334, 3368). Their willingness to make the investment for that return is complete proof that 6.5 percent after taxes is a generous return after the business had been put on a stable basis.[35]

The current level of interest rates, the record of recent natural gas financing, the relative security

---

[35] Exhibit 136, page 1 (R. 2959), reveals that for the five years preceding the hearing the companies enjoyed stable and growing revenues. The companies' own figures show that net earnings before interest, amortization of bond discount and expense, depreciation, depletion and retirements, and net profit after such charges, as fixed by the companies, were:

Year	Net earnings° before other charges	Net profit after other charges
1935	$8,532,277.12	$2,168,017.77
1936	10,343,134.88	3,619,667.25
1937	10,796,261.76	4,547,717.15
1938	9,910,662.19	3,514,249.97
Eight months ended (Ex. 187, R. 3784)—		
August 31, 1938	6,437,963.07	2,255,799.38
August 31, 1939	7,228,281.71	3,484,783.80

of the investment and the exceptionally strong position of the companies convinced the Commission that, at the time of the rate order, the companies could readily finance the enterprise at 6.24 percent with interest covered 4.68 times (R. 3939).[36] In view of the expert testimony to that effect (R. 2275–2276), as well as of the controlling factors we have mentioned, the Commission's allowance of a 6½ percent rate of return cannot be held unreasonable, but must, on the contrary, be considered extremely generous.

V

THE COMMISSION'S FINDINGS THAT THE COMPANIES' EXISTING RATES ARE UNREASONABLE AND THAT THE LEVEL OF RATES FIXED BY THE COMMISSION ARE REASONABLE ARE SUPPORTED BY SUBSTANTIAL EVIDENCE

The companies contend that there was no substantial evidence to support the finding of the Commission that the existing rates were unreasonable within the meaning of the statute. They further argue that the considerations which support this conclusion likewise require the conclusion that there is no evidence to support the Commission's finding that the level of rates which it fixed was reasonable (Br., p. 145 *et seq.*). The argument is, apparently, that under the provisions of the Natural Gas Act there must be a finding that the companies' rates are unreasonable, that reasonableness of rates must be determined by the value and benefit of the service rendered, and that, accordingly, the fact that existing rates yield millions of dollars in excess of a fair return on the value of the property is not sufficient evidence to support a finding of unreasonableness. The court below dismissed the contentions because "they ignore the well-established holdings, backed by reason and experience, to the effect that a fair rate of return, on a fairly established rate base, supplies the correct test of reasonableness" (R. 4035). This holding, we submit is plainly correct.

---

[36] The companies seek to create the impression that the figures used by the Commission (R. 3939) show that the companies could not finance themselves at less than 6.72 percent (Br. p. 215). This is erroneous. The testimony (R. 2275–2276), as well as the Commission's opinion, shows that the proper figure is 6.24 percent. This is calculated as

Section 6 of the Natural Gas Act provides:

> (a) The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company,

---

follows: The cost to the companies of bonds would be 40× .0375 or 1.50, the cost of preferred stock would be 20×.061 or 1.22, and the cost of common stock would be 40×.08 or 3.2, plus 10 percent or 3.52. The total is 6.24.

> the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property.
>
> (b) Every natural-gas company upon request shall file with the Commission an inventory of all or any part of its property and a statement of the original cost thereof, and shall keep the Commission informed regarding the cost of all additions, betterments, extensions, and new construction.

This section is modeled directly on Section 208 of the Federal Power Act, which was enacted as part of the Public Utility Act of 1935. As originally introduced in the Senate, this latter provision declared (S. 2796, 74th Cong., 1st sess.):

> SEC. 208 (a) The Commission may investigate and ascertain the actual legitimate cost of the property of every public utility, the depreciation therein, and every fact which in its judgment has any bearing on the determination of such cost or depreciation.
>
> (b) Every public utility upon request shall file with the Commission an inventory of all or any part of its property and a statement of the original cost thereof, and shall keep the Commission informed regarding the cost of all additions, betterments, extensions, and new construction.
>
> (c) In determining just and reasonable rates, the Commission shall fix such rate as will afford the public utility an opportunity

> to earn a fair return on a rate base not in excess of the actual legitimate cost of the property used and useful for the service in question less the accrued depreciation therein.

The avowed purpose of the bill as thus drafted was to place rate regulation on the prudent investment basis. The Senate Committee on Interstate Commerce which reported the bill declared (S. Rep. 621, 74th Cong., 1st sess., p. 52):

> Rate regulation must eventually be based on prudent investment. Recent decisions of the Supreme Court, and the respect which the Court has always paid to the constitutional interpretations of the coordinate branches of the Government, afford grounds for hope that this rule which the committee considers essential to effective rate regulation will be sustained if the Congress should now definitely adopt it as a legislative policy. This would present the case to the Court in an entirely new light.

Prior to the final enactment of the statute, however, this Court in *West* v. *Chesapeake & Potomac Tel. Company,* 295 U. S. 662, reaffirmed the doctrine of *Smyth* v. *Ames.* Accordingly, the bill was reported out in the House with an amendment containing the present Section 208, which is identical with Section 6 of the Natural Gas Act.

It is thus clear that the Commission is authorized to establish reasonable rates on a prudent investment basis and that only if it is "found necessary", (apparently because the rule of *Smyth* v. *Ames*), is there any occasion to consider facts bearing on "fair value". Whether the Constitution requires the adoption of the fair value basis or permits the application of prudent investment principles, however, the reasonableness of the rate is measured by the investment or fair value and not the value of the service to the consumer. If fair value is the test, the utility is entitled to a "fair return upon the reasonable value of the property at the time it is being used for the public". *Los Angeles Gas Co.* v. *Railroad Commission*, 289 U. S. 287, 305; *Railroad Commission* v. *Pacific Gas Co.*, 302 U. S. 388, 394-395; *Denver Stock Yard Co.* v. *United States*, 304 U. S. 470, 475.[37] This Court, it is true, has on occasion suggested that a "reasonable" rate may be higher than a "barely non-confiscatory" rate. See *Banton* v. *Belt Line Ry.*, 268 U. S. 413, 422–423; *Columbus Gas Co.* v. *Public Utilities Commission*, 292 U. S. 398, 414. Section 5 (a) of the Act, however, which declares that "the Commission may order a decrease where existing rates * * * are not the lowest reasonable rates," was obviously designed to remove this hazy distinction and to authorize the Commission, in its discretion, to put in effect the lowest rates consistent with constitutional requirements.

---

[37] The case of *Canada Southern R. Co.* v. *International Bridge Co.*, [1883] 8 L. R. App. Cas. 723, cited by the companies to support a contrary ruling (Br. p. 151), is not in point. That was a suit between private parties, and it was conceded that the actual rates charged were reasonable. In this view, the court held that it would be improper to look to the company's profits to find unreasonableness. The court observed, however, that the legislature could provide otherwise. The dicta in *Cotting* v. *Kansas City Stock Yards Co.*, 183 U. S. 79, 95–97, which lends some support to the companies' position, are not in accord with the subsequent decisions of this Court.

There is in fact no other basis available to the Commission. The "value" of an essential service to the consumer obviously cannot be determined. See Brandeis, J., dissenting, in *St. Louis & O'Fallon Ry. Co.* v. *United States,* 279 U. S. 461, at 536–537; cf. Whitten-Wilcox, *Valuation of Public Service Corporations* (2d ed. 1928) pp. 248–250. And no useful purpose could be served by comparison of the companies' rates with those of other gas companies, since the comparison is not significant unless the rates of the other companies are reasonable. Cf. *Los Angeles Gas Co.* v. *Railroad Commission,* 289 U. S. 287, 305.

There can be no doubt that, under either the investment or fair value test, the rates charged by the companies are "unreasonable" and the level of rates prescribed by the Commission are "reasonable" in the sense of the statute. As we have shown above, the potential earnings of the companies at the level of rates ordered by the Commission are more than sufficient to earn a return of and a return on the investment, together with all other costs of operation. On the investment principle, therefore, the Commission was permitted to find that the level of rates which it prescribed was reasonable and that the existing rates, which were above that level, were unreasonable. And though it was "found necessary" by the Commission to consider the reproduction cost in order, no doubt, to remove any possible doubt as to the validity of the order, the companies cannot seriously suggest that the addition to rate base allowed them as a consequence was "unreasonable."

If "fair value" is the test of constitutional validity and if, therefore, it is "found necessary" to consider the facts bearing on such value in order for the Commission to discharge its statutory responsibility, the rates are nevertheless "reasonable" in the statutory sense. For then the constitutional and statutory standards are the same and, for the reasons advanced in Point IV, the Commission's conclusions were correct, both as to result and, if this be necessary, as to method of valuation.

VI

SMYTH *v.* AMES IS NOT BASED ON SOUND PRINCIPLES AND SHOULD BE OVERRULED

In the case of *Driscoll* v. *Edison Light & Power Company*, No. 509, October Term, 1938, the United States filed a brief as *amicus curiae* asking that *Smyth* v. *Ames* be overruled. We have reprinted excerpts from that brief as a supplement to this brief, showing that the present fair value rule is unworkable and unsound, that it has led to a breakdown of the rate-regulation process, and that it is contrary to the overwhelming weight of professional opinion. Here, we shall show, in addition, that the rule is based on legal principles drawn from the law of eminent domain which have no place in rate making, that in rate regulation the sole appropriate test is one of the reasonableness of the regulation and that a method of rate making which gives a fair return on the capital prudently invested in the enterprise is reasonable.

A. *The fair value rule is based on eminent domain concepts*

The rule that a rate is confiscatory unless it enables the utility to earn a fair return on the present fair value of its property is based on the doctrine in the law of eminent domain that "just compensation" must be paid for property "taken" for public use. The Court pointed this out in *West* v. *Chesapeake & Potomac Tel. Co.*, 295 U. S. 662, 671, saying:

> * * * When the property itself is taken by the exertion of the power of eminent domain, just compensation is its value at the time of the taking. So, where by legislation prescribing rates or charges the use of the property is taken, just compensation * * * is a reasonable rate of return upon that value.

The historical development of the fair value rule shows that the law of eminent domain was in fact its source. At first in *Munn* v. *Illinois,* 94 U. S. 113, and companion cases, the Court held that "the people must resort to the polls, not to the courts" for protection against abuses in rate regulation (94 U. S., at 134). Later, however, the Court receded from this extreme view and held that the question of the reasonableness of rates was a judicial question (*Railroad Commission Cases,* 116 U. S. 307, 325, 331; *Chicago Ry.* v. *Minnesota,* 134 U. S. 418), pointing out that unreasonably low rates could not validly be prescribed because that would amount to a deprivation of property without due process of law or a taking of property without just compensation. *Railroad Commission Cases,* 116 U. S. 307, 325, 331; *Georgia Railroad & Banking Co.* v. *Smith,* 128 U. S. 174, 179; *Chicago Ry.* v. *Minnesota,* 134 U. S. 418, 458; *Budd* v. *New York,* 143 U. S. 517, 547. Then, in *Reagan* v. *Farmer's Loan & Trust Co.,* 154 U. S. 362, the "fair value" rule emerged; the Court invalidated a rate order under which the company could not pay even one-half of its bond interest and said, *obiter* (p. 410):

> * * * If the State were to seek to acquire the title to these roads, under its power of eminent domain, is there any doubt that constitutional provisions would require the payment to the corporation of just compensation, that compensation being the value of

> the property as it stood in the markets of the world, and not as prescribed by an act of the legislature? Is it any less a departure from the obligations of justice to seek to take not the title but the use for the public benefit at less than its market value?

The analogy of a "taking" was not expressly referred to again until *Smyth* v. *Ames*, but in *Covington & Lexington Turnpike Road Co.* v. *Sandford*, 164 U. S. 578, 596, the Court observed that rates fixed so low as to destroy the value of property for all purposes would be invalid as a deprivation of property without due process of law. Finally the lower court in *Smyth* v. *Ames* held that the principles of eminent domain must apply in rate regulation, saying (*Ames* v. *Union Pacific Ry.*, 64 Fed. 165, 177 (C. C. Neb.)):

> Now, if the public was seeking to take title to the railroad by condemnation, the present value of the property, and not the cost, is that which [it] would have to pay. In like manner, it may be argued that, when the legislature assumes the right to reduce, the rates so reduced cannot be judged unreasonable if, under them, there is earned by the railroad company a fair interest on the actual value of the property. * * *

Thus this test extracted from the law of eminent domain became the basis of the "fair value" rule of *Smyth* v. *Ames* for determining the constitutionality of rates. See Henderson, *Railway Valua-*

tion and the Courts, 33 Harv. L. Rev. 902, 906–912; Hale, *Conflicting Judicial Criteria of Utility Rates,* 38 Col. L. Rev. 959, 960–964. As we have shown, the rule is still placed on that basis (*West* v. *Chesapeake & Potomac Tel. Co., supra*) and is invoked notwithstanding that when *Smyth* v. *Ames* was decided original cost exceeded "present fair value" and the rule was adopted to show that rates could be based on a value less than original cost. Today it is invoked to prevent rate regulation on any basis other than "present fair value" however much that value may exceed the cost of the property.

B. *The eminent domain concept of present fair value has no place in rate regulation*

In practice the "present value" test to which the Court has thus far adhered makes it impossible to measure the reasonableness of rates by any coherent or feasible standard. Physical property has only a scrap value unless it is capable of earning a return sufficient to justify a larger investment. In other words, the value depends on the earnings. And, since the earnings will depend on the rates to be fixed, the dilemma arises that value depends upon the rates fixed and the rates upon the value. The present fair value rule creates but offers no way out of this dilemma. See Bonbright, *Valuation of Property,* Vol. II, pp. 1094–1098; Hale, *The "Fair Value" Merry-Go-Round,* 33 Ill. L. Rev. 517–520.

The practical impossibility of developing a workable rule under the present fair value concept arises fundamentally from the fact that in principle the doctrine that "just compensation" must be paid for property "taken" has no application in the field of rate regulation. See Hale, *Conflicting Judicial Criteria of Utility Rates,* 38 Col. L. Rev. 959, 963.[38] This should have been apparent when *Smyth* v. *Ames* was decided. Prior to that decision, it had already been established in a utility condemnation case that "the value of the property, generally speaking, is determined by its productiveness—the profits which its use brings to the owner" (*Monongahela Navigation Co.* v. *United States,* 148 U. S. 312, 328–329; see also *C. C. C. & St. L. Ry.* v. *Backus,* 154 U. S. 439), and that compensation must be paid not only for [illegible] physical property but also for the franchise. Earning power under the old rates thus became the test of value in condemnation cases. Hale, *The "Fair Value" Merry-Go-Round,* 33 Ill. L. Rev. 517, 519–520; Hale, *Conflicting Judicial Criteria of Utility Rates,* 38 Col. L. Rev. 959, 964.[39] In a rate case, however, as we have shown, the earning power necessarily depends on the rates to be allowed, which is the very question at issue, and unless earning power under the old rates is adopted as the measure of value, which obviously would prevent any reduction, the whole process becomes involved in a vicious circle. Bonbright, *op. cit. supra,* pp. 1094–1098; Bauer & Gold, *op. cit. supra,* 49 *et seq.,* 141–147; Hale, *The "Fair Value" Merry-Go-Round,* 33 Ill. L. Rev. 517–520; Henderson, *Railway Valuation and the Courts,* 33 Harv. L. Rev. 1031. As Mr. Justice Brandeis pointed out in his concurring opinion in *Southwestern Bell Tel. Co.* v. *Public Service Comm.,* 262 U. S. 276, 292:

---

[38] It was precisely this principle of "just compensation" that led Mr. Justice Field in 1877 to dissent in *Munn* v. *Illinois,* 94 U. S. 113, and to deny any power in the states to regulate rates. 94 U. S. at 143.

[39] Of course, where the property of a nonutility without franchise is condemned, it is only the physical property and not the earning power or prospective profits that are taken and paid for. *Mitchell* v. *United States,* 267 U. S. 341; *Joslin Co.* v. *Providence,* 262 U. S. 668; *Bothwell* v. *United States,* 254 U. S. 231.

> The rule of *Smyth* v. *Ames* sets the laborious and baffling task of finding the present value of the utility. It is impossible to find an exchange value for a utility, since utilities, unlike merchandise or land, are not commonly bought and sold in the market. Nor can the present value of the utility be determined by capitalizing its net earnings, since the earnings are determined, in large measure, by the rate which the company will be permitted to charge; and, thus, the vicious circle would be encountered. * * *

See also *Los Angeles Gas Co.* v. *Railroad Commission,* 289 U. S. 287, 305; Mr. Justice Stone dissenting in *West* v. *Chesapeake & Potomac Tel. Co.,* 295 U. S. 662, 689.

Moreover, the strict application of the eminent domain principle of "just compensation" to rate cases would render all rate regulation invalid. Present value would have to be measured by earnings at the old rates, and would be calculated by capitalizing those earnings at the prevailing rate of returns for investments involving similar risks. On the rate base thus determined, a fair return would have to be allowed which would, of course, be the rate of return on investments involving similar risks. The result would be no change in rates at all. The obvious truth of the matter is that every rate reduction which reduces the net earnings of a utility *ipso facto* reduces the value of that utility; if the value prior to the rate reduction must be preserved for constitutional reasons, it necessarily follows that every rate order which reduces that value is invalid.[40]

---

[40] It is no answer to say that the dilemma is false because the actual market value will be less than the capitalized earnings by reason of the fact that the market will take into account the prospect of future rate regulation. A business has greater value if its owner can anticipate earnings in excess of just and reasonable profits, and the prospect of future regulation does not entirely diminish that anticipation. Hale, *The "Fair Value" Merry-Go-Round*, 33 Ill. L. Rev. 517, 530. If, therefore, under eminent domain principles, market value, which is earning power in the case of a public utility, sets the measure of "just compensation," and if rates must be fixed to pay the utility "just compensation" in the eminent domain sense, rates can never be reduced below the market expectations prior to the rate proceedings, and adequate rate regulation is still impossible.

This Court, while not professing to abandon the "taking" theory with its corollary requirement of "just compensation" (see *West* v. *Chesapeake & Potomac Tel. Co.,* 295 U. S. 662, 671), has adopted the logically inconsistent position that some rate regulation is permissible. In part the Court has permitted the exclusion of value supposedly due to "monopoly" position (*Clark's Ferry Co.* v. *Public Service Commission,* 291 U. S. 227, 238; see Whitten, *Fair Value for Rate Purposes,* 27 Harv. L. Rev. 419, 421–423; Richberg, *A Permanent Basis for Rate Regulation,* 31 Yale L. J. 263, 267), although an exclusive franchise is an element of value in a condemnation case. *Monongahela Navigation Co.* v. *United States,* 148 U. S. 312, 328–329. As Mr. Justice Brandeis remarked in *Southwestern Bell Tel. Co.* v. *Public Service Commission* (262 U. S. 276, 310–311):

> Value is a word of many meanings. That with which commissions and courts in these proceedings are concerned, in so-called confiscation cases, is a special value for rate-making purposes, not exchange value. This is illustrated by our decisions which deal with the elements to be included in fixing the rate base. In *Cedar Rapids Gas Light Co.* v. *Cedar Rapids,* 223 U. S. 655, 669; and *Des Moines Gas Co.* v. *Des Moines,* 238 U. S. 153, 165, good will and franchise value were excluded from the rate base in determining whether the prescribed charges of the pub-

lic utility were confiscatory. In *Galveston Electric Co.* v. *Galveston,* 258 U. S. 388, the cost of developing the business as a financially successful concern was excluded from the rate base. In *Des Moines Gas Co.* v. *Des Moines,* 238 U. S. 153, 171, the fact that the street had been paved (and hence the reproduction cost of laying gas mains greatly increased) was not allowed as an element of value. But, obviously, good will and franchise value are important elements when exchange value is involved. And where the community acquires a public utility by purchase or condemnation, compensation must be made for its good will and earning power; at least under some circumstances. * * *

The very existence of the power to regulate rates, therefore, shows that the concepts of "just compensation" and "fair value," drawn from the law of eminent domain, have no place in rate cases. Bonbright, *op. cit. supra,* pp. 1092–1096; Bauer and Gold, *op. cit. supra,* p. 147; Beutel, *Valuation as a Requirement of Due Process,* 43 Harv. L. Rev. 1249, 1267; Hale, *The "Fair Value" Merry-Go-Round,* 33 Ill. L. Rev. 517, 519, 530; Hale, *Conflicting Judicial Criteria of Utility Rates,* 38 Col. L. Rev. 959. When property is taken under the power of eminent domain the owner "is entitled to the full money equivalent of the property taken and to be thereby put in as good position pecuniarily as it would have occupied if its property had not been taken." *United States* v. *New River Collieries Co.*, 262 U. S. 341, 343. As we have shown, since value depends on earning power, the reduction of rates and consequent diminution of earnings necessarily diminishes the value of the utility property. Accordingly, it is to assert two mutually contradictory and inconsistent principles to say on the one hand that rate regulation is valid and on the other hand that rate regulation must secure to the property owner "just compensation" in the sense in which that term is used in the law of eminent domain.

C. *Rate regulation should be deemed violative of due process only if arbitrary or unreasonable*

The inconsistency is avoided once it is understood that rate regulation is not the taking of property for public use but is simply an exercise of regulatory power. Eminent domain is the power to command a sale; it involves a transfer of a title or a use which is essential to the Government's need, and not the curtailment of a private use or a restriction of private economic relations. Under the power of eminent domain, the public welfare is promoted by taking the property from the owner and appropriating it to some particular use. Lewis, *Eminent Domain* (3d ed. 1909), sec. 6. It is evident, therefore, that eminent domain concepts apply only where property is appropriated to the public use and where the taking is justified, not because the property taken or the use of it is a public nuisance or other obstacle to valid legislative ends, but because it is needed for some valid public purpose or project. Nichols, *Eminent Domain* (2d ed. 1917) p. 278; Orgel, *Valuation under Eminent Domain* (1936) p. 2; see Gardner, *The Massachusetts Billboard Decision,* 49 Harv. L. Rev. 869, 889–892.

The regulation of rates, on the other hand, promotes the public welfare, not by a "taking", but by regulating and restricting the owner's use and enjoyment of his property. Lewis, *Eminent Domain* (3d ed. 1909), secs. 246, 249. And it is, of course, elementary that Congress may subject the use of privately owned property to reasonable limitations in order to serve valid legislative ends, even though the regulation diminishes the value of the property. As Mr. Justice Holmes remarked in *Block* v. *Hirsch,* 256 U. S. 135, 155:

> The fact that tangible property is also visible tends to give a rigidity to our conception of our rights in it that we do not attach to others less concretely clothed. But the notion that the former are exempt from the legislative modification required from time to time in civilized life is contradicted not only by the doctrine of eminent domain, under which what is taken is paid for, but by that of the police power in its proper sense, under which property rights may be cut down, and to that extent taken, without pay. * * *

Examples of valid legislative regulations which diminish the value of property without compensation are common. Thus, a state may declare that nets used on the waters of the state or on its shores in violation of fish protection statutes shall be summarily destroyed (*Lawton* v. *Steele*, 152 U. S. 133); that the manufacture of oleomargarine shall be prohibited (*Powell* v. *Penna.*, 127 U. S. 678); that the manufacture of intoxicating liquors shall be prohibited (*Mugler* v. *Kansas*, 123 U. S. 623, 661); that the business of conducting a livery stable shall not be carried on within certain territorial limits (*Reinman* v. *Little Rock*, 237 U. S. 171); that bricks shall not be manufactured within certain territorial limits (*Hadacheck* v. *Los Angeles*, 239 U. S. 394); that riparian owners shall not divert waters of a state into another state (*Hudson Water Co.* v. *McCarter*, 209 U. S. 349, 355): that the emission of smoke from buildings is unlawful even though the prevention of such emission would require the discontinuance of use of property and would involve much expense (*Northwestern Laundry* v. *Des Moines*, 239 U. S. 486); and that tanks containing inflammable fluid must be kept underground (*Standard Oil Co.* v. *Marysville*, 279 U. S. 582). Indeed, this Court upheld a statute which required the cutting down of red cedar trees of ornamental value to prevent infection of apple orchards. *Miller* v. *Schoene,* 276 U. S. 272. In that case, this Court stated (pp. 279–280):

> * * * When forced to such a choice the state does not exceed its constitutional powers by deciding upon the destruction of one class of property in order to save another which, in the judgment of the legislature, is of greater value to the public. * * * And where the public interest is involved preferment of that interest over the property interest of the individual, to the extent even of its destruction, is one of the distinguishing characteristics of every exercise of police power which affects property. * * *

See also *Euclid* v. *Ambler Co.,* 272 U. S. 365; cf. *Pennsylvania Coal Co.* v. *Mahon,* 260 U. S. 393. Such reasonable restrictions on the use of property in the interest of the public have been held not to be "takings." *Monongahela Bridge Co.* v. *United States,* 216 U. S. 177, 193; *Union Bridge Co.* v. *United States,* 204 U. S. 364, 388–403; *West Chicago Street Railway* v. *Chicago,* 201 U. S. 506, 524; see Gardner, *The Massachusetts Billboard Decision,* 49 Harv. L. Rev. 869, 889–892.

Price regulation stands on the same footing as other exercises of the police power: the sole test is one of reasonableness. For example, in *Nebbia* v. *New York,* 291 U. S. 502, this Court, after observing that there was nothing "peculiarly sacrosanct about the price one may charge," concluded that "price control, like any other form of regulation, is unconstitutional only if arbitrary, discriminatory, or demonstrably irrelevant to the policy the legislature is free to adopt, and hence an unnecessary and unwarranted interference with individual liberty." (291 U. S. at 532, 539.)

These principles apply to rate regulation, for such regulation is nothing more than one phase of the broader field of price fixing. No property is "taken"; the use of property is regulated. Indeed, the "taking" concept has not even a superficial relevance to utility regulation except where the state requires a utility to extend its service (*New York & Queens Gas Co.* v. *McCall,* 245 U. S. 345; *New York ex rel. Woodhaven Gas Light Co.* v. *Public Service Commission,* 269 U. S. 244) or forbids abandonment if the utility continues to do business anywhere within the state. *United Gas Co.* v. *Railroad Commission,* 278 U. S. 300, 308–309.[41] In some early cases, the power to fix prices or rates was explained by saying that the regulated company had "dedicated" its property to the public use. It is evident, however, from the fact that the property remains private property that there has been no true "dedication." *Minnesota Rate Cases,* 230 U. S. 352, 431–432; *Interstate Commerce Commission* v. *Oregon-Washington R. Co.,* 288 U. S. 14, 40–41.

---

[41] No question of forbidding abandonment or compelling an extension is involved here. Moreover, the duty to continue or extend service is based upon the community's dependence for which the utility is responsible. Cf. Cardozo, J., dissenting in *Interstate Commerce Commission* v. *Oregon-Washington R. Co.*, 288 U. S. 14, 47. The instances are numerous and familiar in which a duty has been founded on dependence or reliance and in which the concepts of eminent domain are manifestly irrelevant. See, e. g., *Moch Co.* v. *Rensselaer Water Co.*, 247 N. Y. 160, 167; *Slater* v. *Illinois Central R. Co.*, 209 Fed. 480 (M. D. Tenn.); *Siegel* v. *Spear & Co.*, 234 N. Y. 479; *Creeley* v. *Creeley*, 258 Mass. 460, 463.

As this Court observed in *Nebbia* v. *New York,* 291 U. S. 502, 534, "The statement that one has dedicated his property to a public use is * * * merely another way of saying that if one embarks in a business which public interest demands shall be regulated, he must know regulation will ensue."

Utility regulation, then, and rate fixing in particular, is not a "taking" of property for public use but an exercise of the police power. The validity of such regulation, therefore, does not depend upon impairment of the value of property; impairment of value is frequently the consequence of regulation. The true test of constitutionality under the due process clause in a rate case, as in all regulatory cases, is simply whether the regulation is reasonable.

D. *It is not unreasonable to limit the earnings of a utility to a fair return upon the capital prudently invested*

In urging that rate regulation which takes investment as the rate base is reasonable and therefore consistent with due process, we do not urge that a legislature may not lawfully select other standards suggested by sound business practice. We do contend, however, that prudent investment is a reasonable measure.

The point requires little elaboration here. Mr. Justice Brandeis, in his concurring opinion in *Southwestern Bell Tel. Co.* v. *Public Service Commission,* 262 U. S. 276, has demonstrated the reasonableness of the investment basis by reference to a wealth of relevant data. Additional data are supplied in the supplement to this brief, where we show that the investment basis of rate regulation is sound and workable; that it is overwhelmingly supported by the great body of professional opinion, and that, despite the adherence by this Court to the doctrine of *Smyth* v. *Ames,* many regulatory bodies have advocated utilization of the investment test. It is significant, too, that practical experience in Massachusetts, California and elsewhere shows that this method is just to the utilities, has attracted capital, and has secured adequate service. Since this basis of rate regulation maintains the company's financial integrity and permits it to raise necessary capital, it cannot be deemed arbitrary. Hale, *Conflicting Judicial Criteria of Utility Rates,* 38 Col. L. Rev. 959, 969–970.[42]

---

[42] "* * * The money necessary for the proper discharge of its public duties, or necessary to finance the whole enterprise, is not the replacement cost. * * * To raise that necessary money, it will be requisite that the company have a prospect, in the assumed case, of earning 9% on the full

The contrast of the record of that experience with the confusion resulting from application of the fair value rule emphasizes the reasonableness of the investment test. On the basis of long experience, almost all informed opinion is agreed that effective rate regulation under the present value test is a practical impossibility. In the supplement to this brief we show that the rule is unrelated to the end sought, i. e., the allowance of a compensatory return on property devoted by investors to the public service, that it produces arbitrary, unreliable, and absurd results, and that it results in a breakdown of the regulatory process.

The argument commonly advanced for the present value rule is that the basis of rate regulation is the necessity of providing an effective substitute for conditions of competition and that, since under conditions of competition, present or reproduction cost and not original investment controls the prices charged the consumer, the same principle must be applied in rate regulation. See Whitten, *Fair Value for Rate Purposes,* 27 Harv. L. Rev. 419, 421; Richberg, *A Permanent Basis for Rate*

---

actual prudent cost defrayed by the investors, no matter how much less it would have cost at the time of the regulation. It will be unnecessary for the purpose that the company have a prospect of earning 9% on anything more than actual prudent cost, no matter how much more it would have cost had the plant been built at the time of the regulation. Money sufficient for building the plant at higher replacement costs is not necessary for the proper discharge of the company's public duties." Hale, *op. cit. supra*, at 970.

Regulation, 31 Yale L. J. 263, 277. The argument, it may be noted, in effect concedes that the full measure of just compensation required in the case of a taking under eminent domain is not required in rate regulation, since the standard of competition permits the reduction of earning power, that is, the value of the property, below the level existing under monopoly conditions. It seems equally clear that, as a matter of due process, there is ample reason to believe that the competition theory is not only unworkable in practice but is not properly related to the legitimate aims of utility regulation. The cost of reproduction which is a measure of prices in private industry is the cost, not of reproducing the identical property, but of reproducing the service. Whitten, *op. cit., supra,* at 426–427; Richberg, *op. cit., supra,* at 277. Such a basis for rate making is entirely unfeasible, because it would require the rate-making agency to decide, upon conflicting evidence, the engineering question of how a plant should be constructed in order most efficiently to render the service now rendered by the utility, and then to determine the cost of building this hypothetical plant (*id.*). Moreover, conditions of competition offer a very imperfect standard for rate regulation. The competitive price may yield large profits to the low cost producer but it brings ruin to the high cost producer. The public, however, has a definite interest in preventing financial distress which will prevent efficient public service. Bonbright, *Merits of Original Cost and Reproduction Cost*, 41 Harv. L. Rev. 593, 621–622.

It is true that to measure the rate base by the sum prudently invested does not allow the owners of utility property the same appreciation in values which owners of other property enjoy in times of prosperity. By the same token, however, the use of the investment method saves utility investors from the depreciation in values from which investors in other types of business suffer in times of depression. The adoption of this test, therefore, cannot be said to be unreasonable on this ground. Under the rule of *Smyth* v. *Ames*, on the other hand, utility investors get both the benefit of appreciation in property values and protection against depreciation. This is so because, in periods of deflation, regulatory agencies cannot undertake to fix values in strict conformity to *Smyth* v. *Ames* without throwing many utilities into receivership, and this would, of course, deprive consumers of necessary utility service.[43]

---

[43] "Why, say the defenders of reproduction cost, should railway security holders be given any greater insurance against the fluctuations of price levels than is given to the holders of securities in an unregulated enterprise? The answer is that when the investors in small competitive enterprises fall, they may fall alone, but when the holders of railway securities fall, they force the whole community to become unwilling mourners of their downfall." Bonbright, *Merits of Original Cost and Reproduction Cost*, 41 Harv. L. Rev. 593, 621–622; see Whitten, *Fair Value For Rate Purposes*, 27 Harv. L. Rev. 419, 423–424.

Experience of the past decade has shown that in fact electric, gas, and lighting utilities have not shared with the rest of the community in loss of earnings (Ex. 185, schedule 17, R. 3697–3699). As Mr. Justice Brandeis so aptly observed, "The rule by which the utilities are seeking to measure the return is, in essence, reproduction cost of the utility or prudent investment, whichever is the higher." *Southwestern Bell Tel. Co.* v. *Public Service Commission,* 262 U. S. 276, 311. Since the utilities are not compelled to suffer from a decline in values, it is not unreasonable to deny them the increase.[44]

As the Government stated in its brief in *Driscoll* v. *Edison Light & Power Co.,* 307 U. S. 104 (see supplement to this brief, p. 41), the rule of prudent investment, combining as it does exactness, ease of application, and a proper principle for the determination of reasonable return, is the standard for rate making best adapted to modern business conditions and practices in this country. The case at bar offers the Court an opportunity to write off the books the unsound and unworkable rule of rate making enunciated in *Smyth* v. *Ames.* We urge, therefore, that *Smyth* v. *Ames* be overruled and that this Court now announce that prudent investment is a reasonable and therefore valid basis for the regulation of rates.

---

[44] Even if it be assumed that some account must be taken for the factor of increasing prices, this may readily be accomplished by altering the rate of return. See Whitten, *Fair Value for Rate Purposes*, 27 Harv. L. Rev. 419, 434–435; Richberg, *A Permanent Basis for Rate Regulation*, 31 Yale L. J. 263, 273.

CONCLUSION

The decision of the court below should be reversed and the case remanded with directions to enforce the Commission's order in full.

Respectfully submitted.

APPENDIX A

The Natural Gas Act of 1938, c. 556, 52 Stat. 821, 15 U. S. C., Supp. V, §§ 717–717w, provides:

SEC. 1. (a) As disclosed in reports of the Federal Trade Commission made pursuant to S. Res. 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest.

* * * * *

SEC. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

* * * * *

SEC. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,* That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

* * * * *

SEC. 6. (a) The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property.

(b) Every natural-gas company upon request shall file with the Commission an inventory of all or any part of its property and a statement of the original cost thereof, and shall keep the Commission informed regarding the cost of all additions, betterments, extensions, and new construction.

* * * * *

SEC. 9. (a) The Commission may, after hearing, require natural-gas companies to carry proper and adequate depreciation and amortization accounts in accordance with such rules, regulations, and forms of account as the Commission may prescribe. The Commission may from time to time ascertain and determine, and by order fix, the proper and adequate rates of depreciation and amortization of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas. Each natural-gas company shall conform its depreciation and amortization accounts to the rates so ascertained, determined, and fixed. * * *

* * * * *

SEC. 13. Any State, municipality, or State commission complaining of anything done or omitted to be done by any natural-gas company in contravention of the provisions of this Act may apply to the Commission by petition, which shall briefly state the facts, whereupon a statement of the complaint thus made shall be forwarded by the Commission to such natural-gas company, which shall be called upon to satisfy the complaint or to answer the same in writing within a reasonable time to be specified by the Commission.

* * * * *

SEC. 19. (a) Any person, State, municipality, or State commission aggrieved by an order issued by the Commission in a proceeding under this Act to which such person, State, municipality, or State commission is a party may apply for a rehearing within thirty days after the issuance of such order. The application for rehearing shall set forth specifically the ground or grounds upon which such application is based. Upon such application the Commission shall have power to grant or deny rehearing or to abrogate or modify its order without further hearing. Unless the Commission acts upon the application for rehearing within thirty days after it is filed, such application may be deemed to have been denied. No proceeding to review any order of the Commission shall be brought by any person unless such person shall have made application to the Commission for a rehearing thereon.

(b) Any party to a proceeding under this Act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. * * * No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which is supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in sections 239 and 240 of the Judicial Code, as amended (U. S. C., title 28, secs. 346 and 347).

* * * * *

---

[1] The Commission's annual allowance for amortization, $1,557,852, is slightly less than that required to yield $78,284,000 in 23 years at 6½% interest compounded annual. This slight error, however, is plainly *de minimus* and is not complained of by the companies here.

SUPPLEMENT TO THE BRIEF FOR THE FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION CONSISTING OF EXTRACTS FROM THE GOVERNMENT'S BRIEF IN DRISCOLL v. EDISON LIGHT & POWER CO., NO. 509, OCTOBER TERM, 1938

The following material consists of extracts from the brief filed by the United States, as *amicus* *curiae,* in *Driscoll* v. *Edison Light & Power Co.,* No. 509, October Term 1938. The material reprinted appeared in the original brief at pages 29 to 138. The few omissions have been noted by asterisks. For purposes of clarity, page, heading and footnote numbers have been changed.

I. THE FAIR VALUE RULE WITH ITS EMPHASIS ON REPRODUCTION COST HAS PROVED TO BE UNSOUND AND UNWORKABLE * * *

A. *The rule is unrelated to the end sought.*

The constitutional requirement governing the determination of public utility rates is that the utility shall be permitted to earn a compensatory return on the property which it has devoted to the public service. What has been thus devoted is the capital invested in the business, and it is on this that the owners of the enterprise are entitled to a fair return. This was pointed out by Mr. Justice Brandeis, concurring, in the *Southwestern Bell Telephone Co.,* case 262 U. S. at 290:

> The so-called rule of *Smyth* v. *Ames* is, in my opinion, legally and economically unsound. The thing devoted by the investor to the public use is not specific property, tangible and intangible, but capital embarked in the enterprise. Upon the capital so invested the Federal Constitution guarantees to the utility the opportunity to earn a fair return.

The rule of *Smyth* v. *Ames* [169 U. S. 466] embodies the fundamental misconception that it is "value" which has been embarked in the enterprise and on which the investors are entitled to a compensatory return.

There is a further consideration which makes the fair-value rule unsound in principle. In measuring the rate of return, recourse is had to profits and economic conditions generally. The profits of business in general must of necessity, for purposes of comparison, be based upon investment, since that is the basis of accounting and financial reporting. As stated in *Bluefield Water Works, Etc. Co.* v. *Public Service Commission,* 262 U. S. 679, 692:

> A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on *investments* in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. [Italics supplied.]

When rates of return on *investments* increase, it does not follow that the same or even any increase is reflected upon a *fair value* basis. In fact, it is common knowledge that during the period from 1926 to 1929 rates of return on the value of securities actually decreased very substantially, although during the same period higher rates of return for public utilities were prescribed by this Court (*United Railways* v. *West,* 280 U. S. 234). If when rates of return in industry in general are high as based upon investment, but low as based upon the only evidence of value we have, namely, value of securities, and the computed high rates are applied not to investment but to the estimated reproduction cost of properties, a double defect occurs: (1) the application of the rate of return is faulty; and (2) the basis on which it is applied, reproduction cost, is speculative.

This point, we respectfully submit, is worthy of careful consideration. The rate of return on *investment* during the boom years did increase, but as Appendix B, *infra,* pp. 95–97, shows the rate of return greatly decreased on the basis of the market values of securities. Thus in Appendix B it is shown that if 1926 be taken as 100, the index of earnings of composite industries, as related to stock prices, was 78.7 in 1927, 73.9 in 1928, 66 in 1929, 53 in 1930, etc. Thus, increased rates of return based upon *investment* are not attended with increased rates of return based upon market value of securities or, as far as can be ascertained, on market value of properties. It would be proper and consistent to apply the rate of return on investments in industries in general (with elimination, of course, of speculative profits) to the *investment* in public utilities. But it distorts the comparison and leads to double compensation when prices are high, to apply the rate arrived at in the manner indicated not to investment but to a base influenced by high prevailing prices. The rate of return measured by investment should be applied to investment, but only a rate of return on "value" should be applied to value; the two rates should not be confused.

It has been stated that the end sought is just compensation for the use of properties devoted to the public service. The rates of return which are being made on *investment* in other business undertakings, which are attended by corresponding risks and uncertainties, when applied to the reproduction cost of public utility property cannot but work a hardship on either the utilities or the consumers. During periods of high price levels, the hardship is on the consumers. Conversely when low prices prevail, the hardship is on the companies because a low rate would be applied, theoretically at least, to a low base. If this principle were strictly adhered to in depression periods, severe and, perhaps, disastrous consequences to the utilities would inevitably ensue. A literal compliance with the reproduction cost principle permits the utility to reap the profits of every type of unearned increment which accrues to monopolistic or semi-monopolistic enterprises.[1] The inclusion of this element in a rate valuation penalizes the consumer by transferring to the utility valuation the appreciation in property and equipment which is generally attributable to the efforts of the community at large including the consumers of the utility service. It is submitted that the use of the unearned property increment as an element of value, at least for rate-making, is wholly unjustifiable as a matter of sound economic theory or legal principle.[2]

---

[1] For a condemnation of the inclusion of the item of appreciation as an item in the value of the utility see the discussion in the Report of the Federal Trade Commission to

B. The rule produces unreliable, arbitrary, and absurd results

As a matter of practice the two chief elements most commonly considered in arriving at fair value under the rule are original cost and reproduction cost.[3] This Court has indicated that neither element is entitled to full weight but has failed to specify how much weight should be ac-

---

the Senate of the United States on Public Utility Corporations, January 28, 1935. S. Doc. 92, Part 73A, 70th Cong., 1st sess.

[2] See the letter from Mr. W. R. McCann criticizing the appreciation element in reproduction cost estimates submitted to the Special Committee of the American Society of Civil Engineers. *Report of the Special Committee to Formulate Principles and Methods for the Valuation of Railroad Property and Other Public Utilities* in 81 Transactions of the American Society of Civil Engineers, 1311, 1618–1619 (1917).

[3] Booth, *Prudent Investment, Fair Value, and Public Utility Regulations*, 1 Nat. Lawyers Guild Q. 229, 234 (1938). The author is the general counsel of the Illinois Commerce Commission.

corded each element. As stated in *McCardle* v. *Indianapolis Water Company,* 272 U. S. 400, 410:

> * * * this does not mean that the original cost or the present cost or some figure arbitrarily chosen between these two is to be taken as the measure [of fair value]. The weight to be given to such cost figures and other items or classes of evidence is to be determined in the light of the facts of the case in hand.

The utter impossibility of taking two widely divergent amounts arrived at on wholly different bases, the one (original cost) subject to rather exact measurement and the other (reproduction cost) speculative in the extreme, and combining them reasonably so as to produce a legally sufficient result, has led public utility regulatory agencies to make a polite bow to the elements mentioned, but to employ in fact either prudent investment or reproduction cost as the sole criterion of value. It is wholly unreasonable to expect any commission or any court to combine or compare or weigh $10,000,000 representing the investment in electric plant, $15,000,000 representing one engineer's appraisal thereof, and $8,000,000 representing another engineer's appraisal, in such manner as to arrive at present fair value without producing a result arbitrary or at best unreliable.

The main difficulty with the fair value doctrine lies in the reproduction cost element. This element cannot be regarded as value *per se*. The mere fact that an article would cost a great deal to reproduce today is no evidence at all that it is worth the cost of reproducing it. The cost of reproducing the street railways in the United States would run into enormous sums, but it is common knowledge that such railways are not being built but rather are being abandoned because they are unable to earn their way. The fair value principle, by emphasizing reproduction cost, ignores the economic worth or value of property by substituting therefor an arbitrary criterion. Whether or not the street railway industry is economically sound is of no moment to the valuation engineer. He blindly pursues his policy of valuing what he sees and adds lump sums for the intangibles he cannot see. The engineer values what he finds even though the property would never be reproduced in its present form, even though the market value might be nil, or merely the price of salvage. Despite these uncertainties the estimated cost of reproducing the plant and equipment finds its way into the appraisal which is presumed to represent "value."[4]

---

[4] "First, the only possible argument in favor of cost of reproduction springs from the analogous use of cost of reproduction in private competitive business. * * * But the cost of reproduction so far as utilized in establishing prices in private business is not the cost of reproducing the identical property but the cost of reproducing an equally serviceable property. Or, let us say, it is the cost of reproducing the article or service, or an equally useful article or

The theory of reproduction cost, to have any value, must be deemed to have some connection with market value. Yet by its very nature such cannot be the case. There is, generally speaking, no market value for public utility properties; the reproduction cost theory attempts to supply that which does not exist. Value in the last analysis means exchange value—the ability to command other commodities or services in exchange—and this necessarily leads to market value, which is not and cannot be synonymous with reproduction cost.[5]

---

service, and never the cost of reproducing a particular plant. In truth, invention and improvement work changes in all industrial operations so rapidly that it is difficult to find any plant a few years old which would be reproduced by competent engineers in the same form today. Therefore, to utilize the idea of cost of reproduction intelligently is not to utilize the cost of reproduction of any particular property but of a service or of an equally useful service. It must be apparent that such a basis for rate making would open up a new field for speculative estimating, to the increased profit of engineers and lawyers and to the increased confusion of the courts and commissions and would bring increasing instability to all public utility operations." Richberg, *A Permanent Basis for Rate Regulation* (1922), 31 Yale L. J. 263, 277.

[5] In one of the more recent publications the fallacy of using reproduction cost as a measure of value is stated by the authors as follows: "In exchange-value economics the real value of a plant is not determined by the cost of reproducing the identical plant but by the cost of producing the commodity in a new plant having the most modern equip-

The reproduction cost factor is particularly inappropriate as applied to property of electric and communications utilities. It is common knowledge that great strides have been made during the last decade in the science of producing, transmitting, distributing, and utilizing electric energy. The same may be said of the telephone and telegraph industries. There are still in existence old plants, middle-aged plants, and modern plants of every sort and description. Regulatory bodies are prohibited from applying the substitute-plant principle, *McCardle* v. *Indianapolis Water Co.*, 272 U. S. 400, 417, 418; hence there is no recourse but to value the property used in public service. This means, as far as public utility valuation engineers are concerned, that old structures, old poles, and old equipment must be valued on the basis of what it would cost to reproduce them today even though they are not, in fact, being produced and would

---

ment required to produce the article. No one would be willing to invest in an obsolete plant if a new one could be built to be operated at much lower operating expenses per unit of production if such a plant could be built for the same cost as the obsolete one. It is the cost of building a modern plant of similar capacity that determines the value of a plant in an unregulated competitive industry, and not the cost of reproduction of a similar plant. Hence, reproduction cost does not cause the owners of a regulated enterprise to fare the same as the investors in unregulated competitive enterprises." Wilson, Herring, and Eutsler, *Public Utility Regulation:* 126 (1938).

not be reproduced under any imaginable circumstances.[6]

In practice, the indefensible character of reproduction cost figures stands out in bold relief. In arriving at estimated reproduction cost, two essentials are necessary: (1) a complete inventory of property, and (2) a pricing of the items in the inventory.

---

[6] In analyzing the inappropriateness of reproduction cost in its relation to rate regulation, the minority members of the New York Commission on Revision of Public Service Commissions Law stated: "Even if one assumes that the *value of the property*, somehow conceived, is the proper basis of rate control, it by no means follows that cost of reproducing a substantially similar plant even roughly measures that value. This fact must be evident if we take the analogy of any unregulated business property, or of an ordinary commodity used for consumption. The value of a dwelling house, for example, is not measured by the cost of producing a replica unless it may be assumed that, were the existing house destroyed, its owner would find it expedient to build another one just like it. Even more striking is the difference between the value of the assets of a growing, progressive business enterprise and their cost of reproduction. These assets, to be sure, may still be in use, and giving what would be called good service; yet many of them are not giving as good service as could be produced by the most modern type of plant and equipment, constructed in the best possible location, and adapted to existing conditions of demand and of industrial technique. An intelligent appraiser, to be sure, might estimate the replacement cost of these properties as a starting point, but in that case he would write down the reproduction costs ruthlessly, perhaps to a mere fraction of the cost new, as a recognition of the fact that obsolescence, inadequacy, and physical depreciation have greatly impaired their present worth. This, at least, would be the practice of an appraiser who wishes to secure an honest valuation rather than a bloated statement for purposes of 'dressing' the balance sheet." Minority Report, Commission on Revision of Public Service Commission Law (1930), Vol. I, 345.

In computing the inventory, it is necessary to obtain the quantity of physical properties by units of measurement. This means that the size and nature of all structures must be determined, the generating equipment must be listed in detail, the poles must be counted and classified as to size and kind and physical conditions, the miles of wire, by kind and size, must be established, the miles of underground conduit and conductors and the kind and nature thereof (even though not visible because they are below the surface of the ground) must be estimated in some fashion. All property units, therefore, must be either counted, measured, or weighed. Furthermore, the inventory, to have the semblance of scientific precision, must show whether the structure, poles, conduits, etc., are imbedded in soft soil, clay, or rock, and these conditions cannot be determined with any degree of certainty, again because, not being visible, they must be the subject of guesswork. The eye cannot see nor the hand measure all the items which must in some manner or other be accounted for in the hypothetical appraisal. Moreover, the physical condition of all the properties, visible and invisible, must be recorded in the field notes, and allowance made for such condition in computing the so-called "observed depreciation." When it is remembered that telephone, telegraph, and electric power properties extend over enormous areas and the values run into billions of dollars, that all the items represented thereby must be counted, measured, or weighed, it must be recognized that the very method begets errors and must inevitably lead to rampant speculation. It is common knowledge that no two field parties will arrive at the same inventory of physical quantities, and it is likewise common knowledge that a recheck by one field party of the work of another always discloses discrepancies.[7] An analysis and comparison of reproduction cost estimates utilized in a large number of rate cases reveals a startling variation in their substance. (See Appendix C, *infra,* pp. 98–107.)

---

[7] The inaccuracies in the estimates by engineers employed in the valuation task are thus analyzed in a report of a committee of civil engineers engaged in that work: "The practice of those engaged in valuation work, from the beginning of such work up to the present time, has varied widely in the matter of determining the cost of reproduction. Some base such cost on existing physical conditions, others on historic conditions, and still others combine the two. Some engineers have included only those physical property units which were actually created in the construction of the property, that is, they have used historic conditions, as to items of cost, with present-day prices for labor and material. Others have used substitute units, or historic prices, or original instead of present methods of work, and still others have used original conditions, original prices, and original methods, in making an estimate of reproduction cost. * * * This failure of engineers engaged in valuation practice to agree on a uniform conception of reproduction has cast some doubt on the real worth of Cost of Reproduction as one of the measures of value." *Report of the Special Committee to Formulate Principles and Methods for the Valuation of Railroad Property and Other Public Utilities* in 81 Transactions of the American Society of Civil Engineers 1311, 1359 (1917).

But that is not all. The property items or units, after inventory, have to be assembled, grouped, classified, and then priced. The pricing process is a monstrous example of guesswork.[6] The present reproduction cost of old equipment which is no longer manufactured can be computed only by some sort of legerdemain. Current prices of such items are not and cannot be known, but the amount they would cost if they were manufactured in some devious manner must be computed. The cost of labor, involving, in turn, an estimate of labor hours and labor price, must be estimated and myriad items of expense, including hypothetical interest which was never incurred, in some manner determined.

---

[6] In analyzing one of the opinions of this Court involving a question of valuation for rate-making purposes, it has been observed: "In addition to the expert guessing contest involved in estimating reproduction cost, according to present or past prices, the opinion also adds an additional gambling factor in requiring 'an honest and intelligent forecast as to probable price and wage levels during a reasonable period in the immediate future.' For at least one hundred years (and probably for several thousand years) commerce has been offering its greatest prizes to men who could make honest and intelligent forecasts of future prices. Today the management of any large business would pour wealth into the lap of the inspired genius who could make such forecasts. The question is presented as to whether, when such forecasts are impossible (as they are most of the time) public utility commissions should make any effort to regulate public utility rates. Relying upon past prices alone, it would become evident in practically every case, by the time the case reached the Supreme Court, that there had not been an 'honest and intelligent forecast' of future prices. The illusion * * * that a reliable forecast of future prices can be made, is on a par with the illusion which also radiates from the opinion, that there is such a thing as a 'relatively permanent price level.'" Richberg, *Value—By Judicial Fiat* (1927), 40 Harv. L. Rev. 567, 572.

The results so unscientifically computed are necessarily permeated with inaccuracies. That such results are inaccurate is known to every public utilities commissioner. The results of any two engineers arrived at independently are and will be far apart on any large property. (See Appendix C.) In the words of Mr. Justice Holmes, in commenting on a rate case, "every figure that we have set down with delusive exactness [is] speculative." *City of Louisville* v. *Cumberland Telephone and Telegraph Co.*, 225 U. S. 430, 436. As pointed out by the former chairman of the Public Service Commission of Indiana, "no two engineers, taking the same property, the same unit prices, and the same locality, can arrive at the same figure." 55 Amer. Bar Assn. Rep. 799 (1930). Commissioner Joseph B. Eastman of the Interstate Commerce Commission in a concurring opinion in the *O'Fallon Railway* case said: "With cost of reproduction now exceeding original cost in most cases by anywhere from 50 to 80 percent, it is clear that a method of determining value for rate-making purposes which leaves to unguided judgment the weight to be given such widely divergent factors cannot produce satisfactory results and must be made more definite" (124 I. C. C. 3, 52).

A classical example of the wide variations in determining fair value under the reproduction cost theory is contained in the dissenting opinion of Mr. Justice Stone in *West* v. *Chesapeake & Potomac Telephone Company,* 295 U. S. 662, 691, note 7. The reference shows the following variations in results obtained by engineering appraisals of the telephone property as found in the record of *New York Telephone Company* v. *Prendergast,* 36 F. (2d) 54:

Estimating body	Valuation	Increase over the Commission valuation
Majority of Commission	$366,915,493	
Statutory Court	397,207,925	8.2%
Minority of Commission	405,502,993	10.5%
Master's report	518,109,584	41.2%
Company claim based on Whittemore appraisal	528,753,738	44.1%
Company claim based on Stone & Webster appraisal	615,000,000	67.1%

There was in that case a possible error of almost two hundred and fifty million dollars. It must be evident that no group of men, no matter how well trained or informed, could by any process of reasoning come to any proper conclusions from the so-called evidences of value in that case. Only by arbitrary or capricious action could any finding of fair value be agreed upon by a group of men charged with that duty. It is submitted that a method which is so inherently defective and inevitably unreliable cannot qualify as a *sine qua non* of reasonableness in law.[9]

The experience cited above is not isolated or unique; it is typical of the prevailing experience of all regulatory bodies which deal with "fair value." There is shown in Appendix "C," *infra* p. 98, a comparison of estimates of reproduction cost arrived at in 123 rate cases reported for the years 1928 to 1933, inclusive. *The average variation is shown to be 51.50 percent.*

---

[9] As to the significance of the *New York Telephone* case, *supra*, the following observation has been made: "Herein lies the real significance of this case. While it may have lasted considerably longer than the average utility rate proceeding, it is nevertheless typical of the problems and difficulties involved in all rate cases. It illustrates particularly the fact that the *measure* of return to which a utility is entitled is never clear and definite under the prevailing regulatory system. The reciprocal rights of the utilities and the public remain undefined and variable even after most exhaustive investigation. The more thorough the work, the longer it lasts and therefore the more likely it becomes obsolete before final decision. * * * This lack of definiteness as to the fundamental factors of rate control is the bane of the existing regulatory process. It is responsible for virtual breakdown of regulation. It creates and perpetuates conflict of interest. It produces trumped-up evidence, protracted hearings, futile appeals, prohibitive expense, and makes systematic regulation as a regular administrative process an impossibility." Gold, An Example of Rate Litigation and Its Significance (1934), 23 Nat. Mun. Rev. 584, 587.

This court may reasonably conclude from its own knowledge and from the facts disclosed in Appendix C that the reproduction cost estimates of the properties of a large public utility can be little more than a matter of conjecture or speculation. Regulatory agencies, it is respectfully submitted, ought not to be compelled, against their better judgment, to resort to conjecture and speculation in fixing the prices of services which are so vital to the comfort, well-being, and convenience of our citizens. This Court said in the *West* case, *supra*, 295 U. S. at 675:

> It is apparent from what has been said that here the entire method of the commission was erroneous and its use necessarily involved unjust and inaccurate results.

That method (the improper use of price indices) was condemned because it produced unjust and inaccurate results. We submit that a method of rate making which *requires* as an essential component a consideration of reproduction cost is open to even graver objection. The fair-value theory, with its concomitant emphasis on reproduction cost, should not be imposed upon those charged with the duty of seeing that utilities and consumers alike are treated fairly in the fixing of rates.

The "fair value" method of rate-making has led to conclusions demonstrably unsupportable in the face of actual experience. The "fair value" of a utility's property may be many times the actual cost of that property and if, under such circumstances, rates are fixed which fail to yield a "fair return" on this "fair value," those rates must be condemned as confiscatory under the doctrine of *Smyth* v. *Ames, supra.* And this is true no matter how successfully the Company may be able to operate under them, or how liberal the dividends it can pay, or how good the company's credit may be, or what return such rates may afford the Company on its investment prudently made in properties used or useful in the public service. Thus, confiscatory rates under the "fair value" test may enable a utility to operate with outstanding success because confiscation is determined by a method which has no relation to the object sought to be attained. The glaring incongruity between theoretical "fair value" and the actual facts of experience was well illustrated by *Lindheimer* v. *Illinois Bell Telephone Company,* 292 U. S. 151, in which this Court found the theory pursued irreconcilable with the actualities of operation.

No more fatal indictment can be presented against the "fair value" doctrine than that which is offered by the spectacle of successful and prosperous public utilities revealing themselves as the victims of constitutional confiscation upon the criterion of the "fair value" rule. See the dissenting opinion of Mr. Justice Black in *McCart* v. *Indianapolis Water Co.,* 302 U. S. 419, 435. When public utilities find it expedient, as they frequently do, to charge rates lower than those to which they are constitutionally entitled under the doctrine of *Smyth* v. *Ames, supra,* they reveal the true character of the fair-value method of rate making.[10]

C. The rule produces a break-down in the regulatory process

The fair-value rule has proved to be unworkable as part of a regulatory process. The reasons are: (1) the time required to make appraisals and valuations; (2) the unreliability of the results of that method; and (3) the enormous expense involved.

The valuation process, requiring as it does the taking of field inventories and the pricing of the inventory items, cannot be accomplished in a short space of time. Many years are frequently required and assumption upon assumption is made before the speculative result is reached. The long time required to complete a rate case has become common knowledge. The *Ohio Bell Telephone* case, 301 U. S. 292, was in process of adjudication about fourteen years. The Missouri Public Service Commission required over 8 years to reach a determination in its proceedings against the Union Electric Light and Power Company, 17 P. U. R. (N. S.)

---

[10] The presidents of the prosperous Consolidated Gas and New York Edison Companies testified before the Committee on the Revision of the New York Public Service Commissions Law of 1930, that it was the policy of their companies to charge rates lower than those to which they were constitutionally entitled. Minority Report, *Commission on Revision of Public Service Commissions Law* (1930), Vol. I, 351.

337; and over 7 years in its proceedings against the Ozark Utilities Company, 18 P. U. R. (N. S.) 408. The North Dakota Board of Railroad Commissioners required almost 3 years in its proceedings against the Northern States Power Company, 15 P. U. R. (N. S.) 126. The New York Public Service Commission consumed at least 5 years in determining reasonable rates for the Long Island Lighting Company, 18 P. U. R. (N. S.) 65. Twenty-seven months after the initiation of its proceedings against the Westchester Lighting Company (15 P. U. R. (N. S.) 299) that Commission stated:

> To continue this proceeding to completion would require the receipt of additional testimony and evidence on the reproduction cost new of used and useful property—probably both by the company on its own behalf and by the Commission on behalf of the public—depreciation with respect thereto, rate of return, as well as completion of the testimony on and possible additional evidence relating to the market value of land and going value. Judging from past experience, at least another two years would probably be consumed in the presentation of this necessary material, which in return would require that the operating revenues, expenses, and any changes during this period be investigated and evidence presented thereon to bring them down to the date of the final determination.

In his dissenting opinion in the *McCart* case, *supra,* Mr. Justice Black included the following table to illustrate the delays in rate litigation (302 U. S. 435):

	Bill filed	Decided	Time
United Fuel Gas Co. v. Railroad Comm'n, 278 U. S. 300	Dec. 1923	Jan. 1929	5 years.
United Fuel Gas Co. v. Public Service Comm'n, 278 U. S. 322	April 1925	Jan. 1929	3 yrs. 8 mos.
Ottinger v. Brooklyn Union Gas Co., 272 U. S. 579	June 1923	Nov. 1926	3 yrs. 5 mos.
Ottinger v. Kings County Lighting Co., 272 U. S. 579	June 1923	Nov. 1926	3 yrs. 5 mos.
Ottinger v. Consolidated Gas Co., 272 U. S. 576	June 1923	Nov. 1926	3 yrs. 5 mos.
Patterson v. Mobile Gas Co., 271 U. S. 131	Aug. 1922	April 1926	3 yrs. 8 mos.
McCardle v. Indianapolis Water Co., 272 U. S. 400	Dec. 1923	Nov. 1926	2 yrs. 11 mos.
Average			3 yrs. 7 mos.

The proceedings before the Illinois Commerce Commission to determine rates for the Illinois Bell Telephone Company, initiated in September 1921, did not reach a final conclusion until 12½ years later, in 1934. See *Lindheimer* v. *Illinois Bell Telephone Co.,* 292 U. S. 151. More than ten of these years were consumed in litigation in the federal courts subsequent to the Illinois Commission's findings in the case. The *New York Telephone Company* case was instituted in 1920 and determined by the New York Public Service Commission in 1924, yet it was not until 1934 that the case was finally settled. See the concurring opinion of Mr. Justice Brandeis in *St. Joseph Stockyards Co.* v. *United States,* 298 U. S. 38, 90.

It is impossible to keep the regulatory process current under the prevailing rule, and unless that rule is changed the paralyzing delays in fixing proper rates which it makes inevitable will continue to cripple utility regulation.[11] Many utilities in the United States have never had their property valued and others have had but one valuation in the comparatively long history of valuation in this country. This Court is familiar with the experience of the Interstate Commerce Commission in its efforts to arrive at the fair value of railroad properties in this country. During the period from 1913 to 1931, approximately $178,000,000 was expended by the Government and by Class I carriers in their attempt to carry out the valuation process. (Testimony of Mr. Alfred P. Thom, General Counsel of the American Railway Executives Association before the Committee on Interstate and Foreign Commerce of the House of Representatives, February 5, 1932.) It is common knowledge that the difficulty in the application of the rule of *Smyth* v. *Ames, supra,* to railroad valuation was in no small measure the direct cause of the amendment of Section 15a of the Interstate Commerce Act to eliminate the necessity of recurrent valuations. (See testimony of Commissioner Joseph B. Eastman before the Committee on Interstate and Foreign Commerce of the House of Representatives, January 19, 1932.)

---

[11] Concerning the inability of regulatory authorities to carry on their function of rate making under the present system of valuation, one writer has observed that "it slows up regulation and in a great measure makes it ineffective. In practice it takes so much time to decide the question of rates when it is dependent upon a valuation, that, at best, but few cases can be decided by a state authority in a year. Where the authority has a hundred or more companies under its supervision, as is usually the case, it is obvious that there can be but little regulation of their rates. Regulation, to be effective, should be reasonably prompt. If the company needs relief, it should receive it promptly; otherwise the relief prayed for may not suffice when granted, as during the time of protracted hearings the situation may be going from bad to worse and the loss must be compensated by additional increases in the rates. On the other hand, if the public is entitled to a reduction it should receive it promptly, as earnings, by the decisions of the courts, become the property of the corporation and any excess in rates paid by the consumer can never be recovered by him. * * *" Attwill, *Weaknesses of the Valuation System*, 159 Annals of the American Academy of Political and Social Sciences (January 1932) 96, 98. The author is a former chairman of the Massachusetts Department of Public Utilities.

See also Goddard, *The Evolution and Devolution of Public Utility Law*, 32 Mich. L. Rev. 577 (1934).

The very involvements of the fair value method destroy it as a rate-making expedient. With some fluctuations in price occurring daily, valuations made as of one year, after many years of effort, are obsolete by the time they are determined. When it is remembered that frequently several years are required to make an inventory and appraisal, which becomes obsolete twelve months thereafter, the criticism that the regulatory process is unworkable must be recognized as well founded. No approved process whereby valuations such as discussed herein can be kept current or computed quickly has ever been devised. One noteworthy attempt designed to accomplish this purpose, namely, the use of index numbers, was condemned by this Court in the *West* case, *supra.*

The inherent difficulties in administration as well as the inadequacy of the result of the use of the "fair value" rule have led to various schemes for avoiding its harshness and for speeding up the regulatory process. The most notable of these expedients is the Pennsylvania temporary rate statute involved in this case. Regulation must be free from unworkable formulae or Commission regulation is doomed, for the public is becoming increasingly weary of the long, expensive, and tedious procedure involved in public utility rate-making.

The unreliability of the results reached by an attempt to apply the fair value theory has already been dealt with in this brief. Pages 6-20, *supra.*

The third factor is the enormous cost of the process. The making of appraisals with the necessary time and tedious detailed studies costs gigantic sums.[12] While schemes for surmounting the difficulty have at times been evolved such as that for assessing the regulatory expenses against the utilities as in Louisiana (Gen. Stats. 1932, Secs. 7917.3 to 7917.5), New York (Laws, 1934, C. 282), Pennsylvania (Stats. 1920, Sec. 18163), and Wisconsin (Wis. Stat. C. 196, Sec. 85), the consuming public in the end bears the cost.[13]

---

[12] Former Chairman William Prendergast of the Public Service Commission of New York has stated that the appraisal made by the New York Telephone Company cost that Company in the neighborhood of $5,000,000 (Commission on Revision of Public Service Commissions Law (1930), Vol. I, 381). It is estimated that the cost of determining the fair value of all utilities subject to the jurisdiction of the Public Service Commission of New York, even with the cooperation of the utility companies and the adoption of short-cut methods, would run in the neighborhood of $10,000,000 and at least three years would be necessary to arrive at the result. (Minority Report, *Commission on Revision of Public Service Commissions Law* (1930), Vol. I, 394).

---

[13] The expenses involved in valuation projects for ratemaking purposes have been graphically described by Harry R. Booth, General Counsel of the Illinois Commerce Commission, as follows: "In connection with a case recently decided by the Illinois Commerce Commission, the Illinois Bell Telephone Company stated in its annual report that it had spent $1,200,000 in preparation of a state-wide appraisal, and this was subsequent to huge expenditures in the *Chicago Telephone* case. In proceedings before the same Commission involving the Commonwealth Edison Company of Chicago, the company's expenditures totaled approximately $1,000,000, a large part of which was for appraisals; and the People's Gas Light & Coke Company, also of Chicago, spent in excess of $750,000, more than $600,000 of which was for appraisal purposes. In Missouri, two recent cases involved expenditures, mostly for appraisal purposes. Of over $900,000 by the Union Electric Company and nearly $300,000 by the Laclede Gas Light Company, including the Commission's expenses in both cases. * * * By some authorities it is stated that a complete reproduction cost appraisal may be expected to cost from one-half of a per cent to one per cent of the reproduction cost of the property in question. Hence, for the electric, gas, and telephone companies alone, which are reported in *Moody's Manual of Public Utilities for 1937* as having a property value of over $20,000,000,000, the cost of making reproduction cost appraisals might run from $100,000,000 to $200,000,000. * * * The costs incurred by utility companies for such valuations are ordinarily charged to operating expenses, with the result that they are, in effect, paid for by the consumers. Costs in-

The burdens of present day rate-making have been so great that commissions have frequently abandoned the attempt to secure through normal channels of regulation reductions in rates to which consumers were entitled. The New York Commission has stated that "consumers have appreciated that it is better to secure a reduction in rates promptly, even though it may not be as large as should be made, in their opinion, and even though it may not be as large as might be ordered by the Commission after a rate case had been conducted, extending over months and perhaps years, and possibly to be litigated in the courts. * * * It may be pointed out that practically the Commission can cover a wider territory and deal with many more cases by negotiation than it can through formal proceedings. The latter consume far more time of the Commission and its limited staff, with the result that where negotiations with ten companies may be concluded in a few months, it would require several years to make the inventories, appraisals, accounting reports, and engineering investigations which rate cases would require." *1931 Annual Report New York Public Service Commission,* Vol. I, p. 8.

---

curred by cities and public service commissions are ordinarily paid for out of taxes, which fact, of course, exerts a distinctly discouraging influence." Booth, *Prudent Investment, Fair Value and Public Utility Regulation*, 1 Nat. Lawyers Guild Q. 229, 235 (June 1938).

The Public Service Commission of Maryland has stated that it "has been making a study of the operating results of the various utilities under its jurisdiction and where its studies show that there is at least a possibility of effecting a rate reduction it is conducting informal negotiations with the utilities involved, so that the public may receive the benefits of such reductions as may be found to be reasonable and proper without undue delay." *1932 Report of Maryland Public Service Commission 4.*

The Committee on Valuation of the American Electric Railway Association has pointed out the hazards and burdens to the utility industry itself:

> Such valuation proceedings, as heretofore conducted, are excessively costly, require a long period of time, affect adversely the corporation's credit, interfere with its financing upon favorable terms, and frequently cause the postponement of extensions and improvements to the great detriment of the public. Unless and until there is some change in the legal principles which must be applied in determining fair value, however, the industry cannot escape from this situation.[14]

If public regulation of utility rates is to succeed, these unwarranted burdens on industry, the public, and the commissions must be removed. The economic waste involved in the fair value method must be eliminated and there must be substituted a plain and adequate remedy. The fair value doctrine has had a fair trial, but by the verdict of forty years of regulatory experience it has been found hopelessly wanting.

---

[14] Report of the Committee on Valuation of the American Electric Railway Association (1934).

II. Prudent Investment as a Rate Basis is Sound and Workable

A. The basic fallacy underlying the fair-value doctrine is the assumption that "value" rather than "property" has been devoted to the public use. As previously indicated, the object sought to be attained by the limitations of the due process clause is just compensation to those who have devoted their property to the public use. What the Constitution requires is a fair rate of return on the investment of a utility in property used and useful in the public service. The thing devoted to the public use by the investor is not specific property but capital embarked in the utility enterprise. Upon the capital so invested the due-process clause of the Constitution guarantees to the utility the opportunity to earn a fair return. The Constitution does not guarantee to a utility or its investors the opportunity to earn a return either on the "present value" of all the property used by the enterprise or the "cost of reproducing" the property used by the enterprise. This interpretation of due process of law was stated by Mr. Justice Brandeis in his concurring opinion in the *Southwestern Bell Telephone* case, *supra,* as follows (262 U. S. at 290–291):

> The investor agrees, by embarking capital in a utility, that its charges to the public shall be reasonable. His company is the substitute for the State in the performance of the public service; thus becoming a public servant. The compensation which the Constitution guarantees an opportunity to earn is the reasonable cost of conducting the business. Cost includes not only operating expenses, but also capital charges. Capital charges cover the allowance, by way of interest, for the use of the capital, whatever the nature of the security issued therefor; the allowance for risk incurred; and enough more to attract capital. The reasonable rate to be prescribed by a commission may allow an efficiently managed utility much more. But a rate is constitutionally compensatory, if it allows to the utility the opportunity to earn the cost of the service thus defined.

This view of investment as the vital factor accords with the position of economists. As stated by Professor Glaeser of the University of Wisconsin:

> Since public utilities render a service which must be supplied continuously, they should be regulated upon a theory that they are or will become going concerns. They are secured in their market position by means of governmental grants which are either ex-

pressly monopolistic or tend to become such under the pressure of noneconomic competition. They have voluntarily invested their capital upon the implied assurance that they will be permitted to earn reasonable returns. Under modern conditions of regulation the investment of capital may even be compelled by governmental authorities or it is at least invested subject to governmental authorization and approval. Under these conditions of regulated monopoly, the true economic standard for determining the rate base is the investment standard.[15]

B. Prudent investment affords a stable rate base, with all its accompanying advantages to investors and consumers. These have been summarized in the opinion of Mr. Justice Brandeis, concurring in the *Southwestern Bell Telephone Co.* case, *supra,* 262 U. S. 276, 289, 306:

> The adoption of the amount prudently invested as the rate base and the amount of the capital charge as the measure of the rate of return would give definiteness to these two factors involved in rate controversies which are now shifting and treacherous, and which render the proceedings peculiarly burdensome and largely futile. Such measures offer a basis for decision which is certain and stable. The rate base would be ascertained as a fact, not determined as matter of opinion. It would not fluctuate with

---

[15] Glaeser, *Outlines of Public Utility Economics* (1927), 505.

the market price of labor, or materials, or money. It would not change with hard times or shifting populations. It would not be distorted by the fickle and varying judgments of appraisers, commissions, or courts. It would, when once made in respect to any utility, be fixed, for all time, subject only to increases to represent additions to plant, after allowance for the depreciation included in the annual operating charges. The wild uncertainties of the present method of fixing the rate base under the so-called rule of *Smyth* v. *Ames* would be avoided; and likewise the fluctuations which introduce into the enterprise unnecessary elements of speculation, create useless expense, and impose upon the public a heavy, unnecessary burden.

Investors rightly expect a return on the capital which they put into the enterprise rather than on the imaginary fair value or reproduction cost of the property.[16] The advantages of a stable rate base from the standpoint of investors in the enterprise were thus emphasized by a committee of the Investment Bankers Association:

---

[16] "It is a fair assumption that, in general, investors in establishing public utilities have looked to a fair return on their actual investment to compensate them for their outlay, and have not taken seriously into account any appreciation or depreciation in the value of land or in the price of labor and materials entering into the reproduction cost of structures and equipment. They have necessarily assumed that they would be able and would be permitted to receive for their service an amount equal to their actual cost of production, *i. e.*, operating expenses, depreciation, and interest and profits on their actual capital outlay. * * *. The normal actual capital cost as a basis for rate determination, moreover, has a distinct advantage from the standpoint of public

> So nearly as possible, a stabilized basis of property valuation should be developed. This is easier said than done, but candid effort can surely remove some of the chief causes of instabilities that are dependent on variations in commodity price levels and in varying rates of depreciation and obsolescence. Present deflation of values but emphasizes the disturbing effect of too fluctuating bases of value. To arrive at what is fair will call for mutual concessions—from public regulatory bodies, of preconceived notions that often have reflected political expediency rather than economic and basic considerations; from private ownership, of other preconceived ideas of the rights of private property in a regulated business imbued with a public responsibility and trust. Preconceived notions need to be reappraised or set aside, in favor of the answer to be found only after an un-

---

policy. It is desirable that rate schedules should have stability and should not fluctuate with the price of iron pipe or copper wire or with real-estate activity or reactions. A utility is not established for the purpose of speculating in copper wire or iron pipe or land. It must, however, in furnishing its service, invest its money permanently in these things. The utility should not be expected to assume the risks of fluctuations in the price of the land and materials it uses." Whitten, *Fair Value for Rate Purposes*, 27 Harv. La Rev. (1914) 419, 425–426.

biased solution that will more nearly represent public and private rights than any yet applied. This Committee cannot but believe that a sound economic solution will sooner or later receive judicial sanction.[17]

The advantages from the standpoint of the consuming public and the regulatory commissions are self-evident. Protracted, costly, and unsatisfactory controversies over valuation are obviated. Rates can be fixed currently, with a minimum of delay. These considerations are among those that have led many state utility commissions to advocate the adoption of the prudent investment standard.[18]

* * * * *

There are special reasons which make it appropriate to reconsider the rule of fair value and to replace it with the principle of prudent investment.

---

[17] Commercial and Financial Chronicle (November 21, 1931).

[18] The State commissions have been strongly in favor of the prudent investment rate base advocated by the Utility Consumers National Policy Committee. They have been in favor of it, among other reasons, because of the expense and delay caused by minute valuations of utility plants and the many speculative, technical, and highly controversial features such valuations involve. This attitude of the state commissions was referred to in the dissenting opinion of Mr. Justice Brandeis in the *Southwestern Bell Telephone Case* in favor of prudent investment at the rate base." Spurr, *Has Utility Regulation been Reduced to Negotiation and Wheedling?* 21 Pub. Util. Fort. 262 (1937).

The rule of *Smyth* v. *Ames, supra,* was perhaps the only standard which could have been applied at the time it was enunciated by this Court. In 1898, when the rule was announced, regulatory accounting was practically nonexistent in most states. The modern movement toward uniform accounting methods and procedure for local utilities started with the Wisconsin and New York systems which were promulgated in 1908.[19] Since that time, however, accounting regulation has become a major function of public service commissions so that today approximately forty commissions have prescribed a system of accounts for electric utilities. Appendix D of this brief, *infra*, p. 107, contains a list of the state commissions which possess such authority over the accounting practices of public utilities.

It is common knowledge that large amounts of inflation crept into the property accounts of steam railroads during the construction era of their development. Consequently, the accounting book figures in 1898 were wholly unreliable as a basis upon which to compute a just and proper rate.[20] It would appear too from the cases starting with *Munn* v. *Illinois,* 94 U. S. 113, and ending with

Smyth v. *Ames, supra,* that the courts were in a dilemma and were seeking the most reasonable approach to a difficult and troublesome problem. See the opinion of Mr. Justice Brandeis, concurring, in *Southwestern Bell Telephone Company* v. *Public Service Commission,* 262 U. S. at 298–299. The fair value theory in the economic era prevailing in 1898 was about the only theory at that stage of regulatory accounting which appeared to present any satisfactory solution to the problem. It was probably assumed that reproduction cost could be ascertained with a high degree of accuracy. But the intervening forty years have demonstrated beyond peradventure of a doubt that inaccuracy is the most notable feature of reproduction cost appraisals. *Bay State Rate Case,* P. U. R. 1916F, 221, 233. The fair value rule has thus been explained historically:

> With construction reaching back into a dim accounting past, or with the early books destroyed, it is little wonder that in the earlier cases the courts turned away from actual cost, deeming it a thing which could not be ascertained and looked with welcome on estimates of reproduction cost which they were led to believe could be accurately made and readily verified.[21]

When it is considered that we have now had a long period of accounting and security regulation as well as control of mergers and consolidations of utility properties it must be recognized that the situation which called for the decision of *Smyth* v. *Ames, supra,* is no longer existent. When that decision was rendered by this Court it was not generally appreciated that the fair value theory becomes more complicated and difficult of application as utility properties grow in size and expand their operations.[22] What might have been a simple rule thirty years ago becomes today a confounding rule when applied to the huge interstate public utilities like those which are subject to the jurisdiction of federal regulatory agencies. It is important to note here that the present trend of public utility development is toward the merger of operating companies into increasingly larger units.

[21] Whitten & Wilcox, *Valuation of Public Service Corporations* (2d Ed. 1928), Vol. I, 530.

Despite the fact that this Court has repeatedly approved the doctrine of *Smyth* v. *Ames, supra,* to limit the authority of state regulatory bodies to utilize the prudent investment standard, it has nevertheless been advocated by many state commissions. The Massachusetts Commission has stated:

> * * * in the long run, the rate-paying public as well as the investing public will be best served if regulation makes as its *fundamentally guiding principle* an attempt

---

> to protect investments honestly and prudently made and wisely managed. Any other theory * * * makes every rate case an almost interminable and labyrinthine inquiry into values with endless conflicts between so-called experts.[23] [Italics in original.]

In one of its recent cases the California Railroad Commission stated that its advocacy of the prudent investment theory was based on the following considerations:

> The historical method of valuation * * * in rate proceedings is well grounded upon established facts, is not subject to the vagaries of pet theories, unlimited imagination and abrupt fluctuations of current prices and passing conditions, and therefore, indicates a truer measure of value upon which, through the application of rates, a return may be allowed to reimburse the owner for his enterprise and insure the integrity of his capital honestly and prudently invested. * * *[24]

The same commission has expressed the same opinion in many other of its cases. *National City*

v. *Sweetwater Water Corp.* (1933), 3 P. U. R. (N. S.) 405; *Re Coast Valleys G. & E. Co.,* P. U. R. 1924C 40; *Re Southern California Telephone Co.,* P. U. R. 1922C 97; *Re San Joaquin Light & Power Corp.,* P. U. R. 1922D 595; *Re Fresno Traction Co.,* P. U. R. 1925C 566. The prudent investment theory has in fact been discussed and advocated in many decisions by local commissions as a sound solution to the existing difficulties of the rate-making procedure.[25] Following the decision of this Court in the *Pacific Gas & Electric Company* case, 302 U. S. 388, the Wall Street Journal on December 28, 1937, published the results of a survey of the views of the various state regulatory commissions on the question of "fair value." The commissions that expressed their preference were two to one in favor of the prudent investment basis as the best solution to the rate-making problem. The advocacy of the prudent investment doctrine by these agencies is overwhelmingly supported by a great body of professional opinion.[26] We have set out in Appendix A, *infra*, pp. 42–94, a summary and analysis of reasoned expressions of this character.

APPENDIX A

EXPRESSIONS OF OPINION ON THE DOCTRINE OF SMYTH *v.* AMES AND ON THE RULE OF PRUDENT INVESTMENT

INTRODUCTION

Since the decision of this Court in *Smyth* v. *Ames,* there has been extensive discussion of the proper basis for public-utility rate regulation. From the first the use of reproduction cost as a factor has been the subject of acute controversy. The need for reexamination of the question in the interest of effective regulation has been thus emphasized:

> The issue between reproduction cost and actual cost, in relation to "fair value" on which a "fair" return must be allowed, is of grave public importance. It leads to the question whether rate regulation is to be a success or failure, and whether regulation should be continued or abandoned. It has been under almost constant discussion during the last 10 years, and has been the chief object of contention in a vast amount of litigation, and in spite of the almost endless discussion and litigation, there is no legal-economic subject which is more confused and in need of scientific clarification. (Bauer, John, *Reproduction Cost and Desirable Public Utility Regulation,* 2 Journal of Land and Public Utility Economics 408 (1926).)

In order to provide a certain amount of the clarification thus urgently needed, an analysis of the literature on the subject of valuation has been made. It is believed that a brief résumé of the principal arguments will be of assistance in an attempt to establish a sound rate base. The arguments are set forth below under appropriate subtitles.

1. The illusive character of "reproduction cost"

The most serious as well as the most obvious defect in the use of reproduction cost as a factor in the determination of utility rates is its utter lack of precision. The idea of reproduction cost is, at first blush, a simple one, and might in fact be workable in the case of a property of small size and little complexity.

> The original conception of reproduction undoubtedly grew out of simple conditions, such as would be met in estimating the cost of reproducing a building or a single structure. In this case, the difference between the original cost of the building or structure and the reproduction estimate would be due wholly to changes in prices of labor and materials and the change in methods of doing work. (American Society of Civil Engineers, *Valuation of Public Utilities,* 81 Transactions (1917) p. 1362.)

The difficulty is that a utility comprises a vast amount of property which is both far-flung and exceedingly complex.

> This simplicity of condition does not obtain in the case of a great property, the actual construction of which has extended over many years, many of the plant units of which have been renewed or replaced by larger ones than were originally installed, which has undergone changes and alterations, and the history and records of which have not been kept fully and completely. In

> such a case the making of a complete estimate of the cost of replacement or reproduction is a very involved undertaking. (*Id., loc. cit.*)

The result of this situation is not only that the determination of reproduction cost is extremely difficult, but, as has been pointed out, no two experts can reach an agreement upon the figure to be used.

> To this criticism of the vagueness of the court's rule as to valuation can be added another, namely, the practical difficulty of making any valuation at all. In every case examined, there has been a great conflict in evidence. Often, when two valuation experts have been employed by the same party, these experts have each made valuations that differed by a great amount. The difficulty seems to be that of making any accurate valuation of the various assets, tangible and intangible, that make up the plant of a modern public utility. (Howell, Ben R., ***Recent Developments in the Application of the Rule of Smyth* v. *Ames in Valuation Proceedings in the Federal Courts,*** 3 Tex. L. Rev. 412, 432 (1924).)

This difficulty is also recognized by the Committee on Valuation of the American Society of Civil Engineers:

> The practice of those engaged in valuation work, from the beginning of such work up to the present time, has varied widely in the matter of determining the cost of reproduction. Some base such cost on existing physical conditions, others on historic conditions, and still others combine the two. Some engineers have included only those physical property units which were actually created

> in the construction of the property, that is, they have used historic conditions, as to items of cost, with present-day prices for labor and material. Others have used substitute units, or historic prices, or original instead of present methods of work, and still others have used original conditions, original prices, and original methods, in making an estimate of reproduction cost.
>
> This failure of engineers engaged in valuation practice to agree on a uniform conception of reproduction has cast some doubt on the real worth of Cost of Reproduction as one of the measures of value. (American Society of Civil Engineers, *Valuation of Public Utilities,* 81 Transactions (1917), p. 1359.)

An example of the divergence of expert opinion upon the reduction cost of a utility is set forth below, from an analysis of the New York Telephone case:

> The range of "values" in this case reveals that the doctrine of present value is totally devoid of elements for objective tests. For the same property as of the same date, July 1, 1926, there were six different estimates of the fair "value" and fair "return" of the New York Telephone Company for rate-making purposes:

Estimates of fair profits for New York Telephone Company (on intrastate business as of July 1, 1926)

	Fair value	Rate	Fair return
Majority of Public Service Commission	$366,915,493	7%	$25,635,000
Federal Court	397,207,925	7%	27,804,555
Minority of Public Service Commission	405,502,993	8%	32,480,000
Special Master's Report	518,109,584	8%	41,448,777
Company claim based on Whittemore appraisal	528,753,738	8%	42,300,299
Company claim based on Stone & Webster	615,000,000	8%	49,200,000

> The estimates of value thus ranged from \$366,915,493 to \$615,000,000, with a corresponding spread in the return thereon from \$25,635,000 to \$49,200,000. Between the two valuation estimates by the Company's own experts there was a disparity of more than \$86,000,000. Yet all these estimates purported to be based on the requirements of Supreme Court decisions, and at the end of ten years the final guess remains in doubt! Moreover, much new capital has been added since the date of these estimates, new problems of depreciation have arisen, and, indeed, the whole process of valuing the property now in use, must, according to the theory of present value, start all over again. (Frankfurter, *The Public and Its Government* (1930), p. 105.)

Similarly the striking variation of estimates in the *Indiana Telephone Case* has been described:

> A typical instance of this difficulty is seen in the case of *Indiana Bell Telephone Co.* v. *Public Service Commission*, in which there was a difference of \$4,000,000 between the estimates of two of the commission's engineers. In this same case the difference between the highest valuation offered and the lowest was \$19,000,000, or 45 percent of the highest estimate. Experts, working in good faith and including the same items of valuation, arrive at results so far apart as to prove that such proceedings are of little value in determining the true worth of the property. It can thus be seen that, although the courts are working out the elements, or items, that form a proper basis for valuation, the value to be given these items can never be determined with any degree of certainty. The best that can be said for the

> valuation of public utilities under the present method is that the courts have by their guesses as to the correctness of the expert's guesses, made another guess as to the probable value of the utility in question as a basis for the determination of a rate which will assure a fair return on the investment. (Howell, *op. cit.*, p. 44, at p. 43.)

The effect of the indefiniteness of the concept of reproduction cost is that the rate basis is entirely unpredictable. The utility and the regulatory commission are, until the final decision, entirely in the dark, and so is the investor. It is for this reason, among others, that Professor Robert Hale urges the abandonment of the rule of *Smyth* v. *Ames*.

> The time now seems ripe for the Court to overrule *Smyth* v. *Ames* and to repudiate the principles that the rate-making power is subject to limitations pertinent only to the power of eminent domain, and that rates, to be valid, must yield a fair return on "value." It would seem to the present writer desirable if, in a case presenting the issue, the Court should expressly declare (What it held in effect in the *Lindheimer* case) that rates which enable the company to operate successfully and to raise the necessary money (which they do if they yield a fair return on the actual prudent cost), are valid, quite regardless of what return they yield on a "value" in the determination of which reproduction cost plays a part. This does not mean that it would be desirable for the Court to substitute for the rule in *Smyth* v. *Ames*, a requirement that rates must in all cases yield a fair return on actual prudent cost. A state's policy

which fixes rates on that basis cannot be pronounced the only one that is not "arbitrary." The line between those rate regulations that are arbitrary and those that are not, like the line between other valid and invalid exercises of the police power, can better be left to be pricked out as future occasions arise. But counsel could at least advise clients that the validity of particular rates will be determined with reference to facts pertinent to realities. As the decisions now stand, they cannot advise whether the determination will be made with reference to such facts (as in the *Lindheimer* case), or with reference to so-called values in the determination of which no prediction can be made of the weight which the Court will attach to the various elements of actual cost, replacement cost and "going value." They cannot advise whether a company's prosperous condition will be taken as evidence of the adequacy of its rates (as in the *Lindheimer* case), or as evidence of large "going value" whose existence proves the rates to be inadequate (as in the *McCardle* case); nor whether the good physical condition of the company's property will be taken to show that the annual depreciation allowance is excessive and that the rates may accordingly be reduced (as in the *Lindheimer* case), or to show that the "present value" is high and the rates accordingly "confiscatory" (as in *Board of Public Utility Commissioners* v. *New York Telephone Co.*). Certainly *all* of the conflicting decisions of yesterday cannot be the law of today. (Hale, Robert L., *Conflicting Judicial Criteria of Utility Rates—The Need for a Judicial Restatement*, 38 Columbia L. Rev. 959, 976/977 (1938).)

2. *The fallacy of the "competitive price theory"*

One of the most seemingly plausible arguments which have been advanced in favor of the use of reproduction cost as a basis for valuation is that it tends to maintain rates such as would be charged under a system of competition. The competitive price theory has been stated by Professor Bonbright as follows:

> According to this theory, the object of public service regulation is to deprive utility companies of the power to charge a monopoly price. Rates should therefore be fixed at a level which they would probably reach if they were regulated, not by the fiat of government, but by the forces of normal competition. But under competitive conditions the prices of services and of commodities tend to equal their cost of reproduction. Therefore, under conditions of monopoly, utility prices should be made to equal the cost of reproducing the service rendered. And by cost of reproducing the service is meant the price which would just be sufficient to induce investors to put up a new plant and to give service similar to that given by the present company. (Bonbright, James C., *Depreciation and Valuation for Rate Control,* 27 Columbia L. Rev. 113, 124–125 (1927).)

From an economic standpoint there are serious flaws in the competitive price theory. It is an attempt to apply the competitive principle to a regulated monopoly by a logical *tour de force.* This is pointed out by the same authority:

> In bringing to a close this discussion of the valuation problem, the point that should

be stressed above all others is the folly of attempting to regulate the prices of public monopolies so that they will conform as closely as possible to the prices that are assumed to prevail under conditions of free competition. Overlooking the fact that the proposed imitation of competition is a very poor one, overlooking the fact that a governmental control of rates designed to yield a stated return on reproduction costs is not even a good caricature of the automatic control of prices that takes place in a dynamic competitive market, we must still recognize that the attempt to carry over into the field of the large-scale monopoly the same price system that is assumed to prevail in the field of the small competitive enterprise, is bound to result in a serious misfit. One reason why it is a misfit is that the competitive price system disregards so ruthlessly the financial needs of the individual producer. To the low-cost producer it yields profits far beyond the current rate of interest on invested capital; to the high-cost producer it brings deficits that spell bankruptcy and ruin. As long as competition is full and free this process, harsh though it be to the unfortunate producer, may serve very well the interests of the consumer. For what matters it to him that any one producer is crippled, so long as he can turn to a more fortunate rival for his necessary services and commodities? Not so under monopoly. Not so with a railway that is alone in serving a community. Why, say the defenders of reproduction cost, should railway security holders be given any greater insurance against the fluctuations of price levels than is given to the holders of securities in an unregulated enterprise? The answer is that when the in-

> vestors in small competitive enterprises fall, they may fall alone, but when the holders of railway securities fall, they force the whole community to become unwilling mourners of their downfall (Bonbright, James C., *Merits of Original Cost and Reproduction Cost;* 41 Harvard L. Rev. 593, 621-622 (1928).)

A variation of the competitive price idea has been advanced in support of the theory of reproduction cost. It has been contended that the utility investor will receive the benefit of a flexible income; his return will thus be relatively constant in terms of purchasing power. Thus, it is said, as prices rise utility values will also rise, increasing the investor's receipts and protecting him from the effects of a general rise in prices. One defect in this reasoning is pointed out in a very recent treatise upon the subject of regulation of utilities:

> * * * The argument that, since reproduction costs fluctuate widely this basis of valuation is more equitable, in that the fluctuations tend to parallel the fluctuations in the general commodity price level, is partly fallacious. Reproduction costs include a large percentage of labor costs, while the percentage of labor costs in the general price level may be much less. Moreover, the general price level includes the prices of many items that are not included in reproduction estimates (Wilson, Herring & Eutsler, *Public Utility Regulation,* 1938, p. 127).

The assumption that the income of utility investors will be stabilized under such a rule contains a fundamental error:

> These advocates [of the reproduction cost theory] have recently shown signs of shift-

ing their ground while yielding to attacks upon the illogical "replacement value" theory. They have urged that the investment in the dollars of by-gone years should be translated into a "present investment," that is, the amount of money having the purchasing power of the dollars of yesterday in the commodities of today. The original investment, they suggest, was of a certain purchasing power which, although stated in money at the time of investment, must be restated now in terms of equivalent purchasing power. This claim involves the plausible suggestion that owners of public utility securities should be assured a constant income in purchasing power rather than a constant income in dollars that have a fluctuating purchasing power.

One answer to this new line of argument is that the large amount of investment in public utilities is represented in securities having a fixed return, such as bonds and preferred stock. It is hardly reasonable to ask the Government to provide a fluctuating return for these investors, which they will not be able to obtain, but which will be appropriated solely for the benefit of the common stockholders. Another answer is that it is hardly appropriate for the Government to establish a rule which will favor one class of investors at the expense of the entire community. The new claim that investors should be protected against loss from the reduced purchasing power of the dollar is utterly inconsistent with the old theory of basing rates upon the "value" of the property. (Richberg, Donald R., *The Supreme Court Discusses Value,* 37 Harvard L. Rev., 289, 297–299 (1924).)

This fallacy in the reasoning of the advocates of reproduction cost is pointed out in a report by the Federal Trade Commission to the United States Senate dealing, among other things, with valuation:

> Far transcending any other reply to this argument of the proponents of reproduction cost, however, is that it entirely overlooks the fact that public utilities are almost wholly financed through fixed income-bearing securities, that is, bonds and preferred stocks. The Federal Trade Commission's investigation of the public-utility industry covering 91 representative operating companies engaged in the electric-light and gas business, shows that 70 percent of their capital accounts is represented by outstanding bonds and preferred stocks. What is of further significance is the Commission's disclosure that write-ups of the capital assets of these 91 operating companies approximate 23 percent, substantially all of which was reflected in the equity stocks. In the light of these disclosures, it would be no serious exaggeration to say that the representative public utilities of the country, including railroads to a lesser extent, are more than 90 percent financed through fixed income-bearing securities.
>
> Manifestly, fluctuations in the price level do not affect the man owning a $1,000 bond on which he receives 6 percent interest, so far as his dollar investment is concerned. It is clear, then, that any speculative gain or loss, due to the price level, is reflected solely in the common stocks of utilities. Yet it has not been seriously suggested by proponents of reproduction cost that all

> fixed income-bearing utility securities be recalled, and common stock issued in their place (Federal Trade Commission, *Summary Report to the Senate of the United States,* January 28, 1935. Senate Doc. 92, Pt. 73A, 70th Cong., 1st Sess., p. 155).

The fact is that the use of reproduction cost tends to a result precisely opposite to that which its advocates claim for it. Rates are too high after a period of inflation and too low after a period of deflation. See Willis, Hugh Evander, *Significant Changes in Public Utility Law,* 25 Georgetown L. J. 877, 884 (1937).

3. Delay and expense in determining reproduction cost

The delay and expense involved in the determination of reproduction cost constitute a serious practical obstacle to rate regulation. The time-consuming nature of the inquiry has been referred to by Henry ~~C.~~ Attwill, who for many years had been actively concerned with the practical aspects of rate regulation as chairman of the Massachusetts Department of Public Utilities. The valuation system, he writes,

> * * * slows up regulation and in a great measure makes it ineffective. In practice it takes so much time to decide the question of rates when it is dependent upon a valuation, that, at best, but few cases can be decided by a state authority in a year. Where the authority has a hundred or more companies under its supervision, as is usually the case, it is obvious that there can be but little regulation of their rates. Regulation, to be effective, should be reasonably

> prompt. If the company needs relief, it should receive it promptly; otherwise the relief prayed for may not suffice when granted, as during the time of protracted hearings the situation may be going from bad to worse and the loss must be compensated by additional increases in the rates. On the other hand, if the public is entitled to a reduction it should receive it promptly, as earnings, by the decisions of the courts, become the property of the corporation and any excess in rates paid by the consumer can never be recovered by him * * * (*Weaknesses of the Valuation System,* American Academy of Political and Social Sciences, Annals, Vol. 159 (January 1932) p. 96.)

A student of valuation cases writes

> * * * an unreasonable length of time elapses before the courts are able to determine the validity of a prescribed rate. The *Pacific Gas and Electric Company Case,* reversed by the Supreme Court in 1924, and sent back for another valuation proceeding, has been in the courts since 1913. During that time the amount collected by the company above the rate prescribed by the city has been deposited in trust awaiting the outcome of the suit. In many other instances a period of from one to five years elapses after the publishing of a rate schedule before the validity of the rate is determined. Because changing conditions render the previous valuation of little help in determining the question of fair return after such a long time, it is often necessary to have a valuation *de novo,* with its additional expense and delay. (Howell, Ben A., *Recent Development in the Application of the Rule of Smyth* v. *Ames in Valuation Pro-*

ceedings in the Federal Courts, 3 Texas L. Rev. 412, 431 (1935).)
